	Video 0160: Default and Constant Values
	Default Values Constant Values

2 Apparo Portal

2.1 Login

The Apparo Portal is called with <u>http://gateway-servername/foldername</u>.

Protocol and folder names can be defined in the Apparo Configuration Manager.

The login page is optically configurable and does not appear if Single Sign On has been selected in Apparo Configuration Manager.

The design of the login page can be adapted in the Apparo Designer, chapter Settings/login page. The login page is used for all clients.

If the browser does not forward the current user name, the user/password is explicitly requested by the browser via its own login page.

After login, the user sees the portal:

Apparo Admin				Administrator	Apparo Admin	-	Go to Designer	
		+ N	ew	🗙 Delete 🛛 🕞 Copy/Move	e 🛃 Import	🛓 Export	Filter	Q
Portal folders		Entr	ies of	folder Apparo Admin				
Apparo Admin	\sim		Туре	Name	Des	cription		Edit
subfolder1	~		•	subfolder1				•
			Ľ	Action BC with output				•
			Ľ	SAMPL WF Set				•

Language: The Apparo Portal uses the **browser language setting** and offers as languages currently German, English and French. If the browsers language is not supported, then the set default language is used.

2.2 Views

The portal has 2 different output modes for the portals:

List view - suitable for the use with a mouse

- Space-saving
- All functions like export / import / copy / create are offered
- Settings for the port entries are visible in this mode

Tiles view - suitable for the use with smartphones / tablets

- Buttons are hidden in this mode
- The settings for the portals are hidden
- Tile view is particularly useful to create a kind of dashboard with up-to-date key figures.

Variables of the Business Case can be used in the description of the entry

The user can change the output mode with these icons:

Entries of folder Demo		
Type Name	Description	Edit

2.3 Entry types

In the portal, the users can:

- Call Business Cases of the current client
- Call freely definable hyperlinks
- Store entries structured in folders

2.4 Security

Each entry type can be provided with access rights.

2.5 Accessing the Apparo Designer

If the user has the necessary authorization, he can (see top right) with

Go to Designer

... open the Apparo Designer.

2.6 Leaving the Portal

2.7 Portal settings in the client

The portal optics can be adapted via client settings:

2.7.1 Tab "Portal"

P AF	pparo Fa	st Edit							Settings of client Demo				administrator	Demo	
The table be	ellow lists a	II existing clien	ts of this enviro	onment.	A client is a sepa	arated world w	th own connections,	Business Cases, langu	ages and security.

2.7.2 Tab "Colours"

Contains the settings for the portal colors and the color of the portal buttons.

3 Designing Business Cases

In order to design Business Cases in Apparo Fast Edit open the Apparo Designer.

Example:

Demonstration Apparo Fa	nst Edit				administrator	Demonstration	Go to Designer
Entries of folder Demonstration	on						
01. Basics Examples for Table & Single BC. Master-Datail connections, Excel Import, History Feature	02. Workflow Example for a Workflow. Plan data entered in offices and revised by the Controlling.	03. Logging and auditing Example for logging and tracing abilities.	04. Data quality checks	05. Conditional formatting	O6. Security Examples for security based filters and features.	07. Excel Import&Export	
08. Variables Examples for the usage of variables.	09. ActionBC with output Example for a hidden running Action BC.	10. Small data driven apps Example for an app, based on the data source.	11. (Automatic) script & procedure calls Example for calling scripts and executables & DB procedures and functions using buttons and on certain events	12. Creating DB tables and columns Example for the feature automatic creation of tables/columns.	13. Dynamic Forms	14. EIBC Just take your Excel sheets and send them by email. They will be imported into your database, incl. security and data quality.	
15. Procurement demo	16. Smartphone						

The designer link will be defined by the Administrator during installation.

If you do not know where this link is located then ask the administrator who installed Apparo Fast Edit.

If you don't see this entry then the current user is not member of the group of Apparo Designers

Please inform your Apparo Administrator that he must add you into this group first or change the expected security group name in the Apparo Configuration Manager.

3.1 Start screen with a list of all Business Cases

	Business Case Ordner 1	Bu	sine	s Cases von Ordner Demo pag	e #08 logging & auditing

ten	Demo page #07 quality Demo page #08 logging & auditing									
	Demo page #09 variables									
	Demo page #10 Action BC and reports									
	Demo page #11 small applications									
	Demo17									

At the start of the Apparo Designer, you will see a list of all Business Cases that are stored in the Apparo repository. If the Apparo repository does not contain any definition, this list will have no entries.

3.1.1 Definition

Each Business Case is an own application that can be called separately.

Business Cases can be linked together, so that from the user's perspective, a Business Case can also consist of several masks.

All Business Cases are stored in the Apparo repository, which is a separate database.

3.1.2 Buttons and Sorting

+ New	🗙 Delete	Copy/Move	📩 Import	🛓 Export

The following buttons are at your disposal:

- New creates a new Business Case
- Delete deletes all selected Business Cases
- Copy copies all selected Business Cases
- Import imports Business Cases from a file
- Export exports selected Business Cases into a file
- Filter filters all Business Cases from the input string by its ID

The sort can be changed by clicking the orange arrows:

Start Business Case ID 🔶 Name 🗘 Type 🗘 Connection name 🗘 Target table/view 🗘 Last change user 🗘 Last change date 🗘

3.1.3 Folder

Business Cases can be grouped in folders. Inside the folder you can create subfolders.

For the Folders pane, there are three buttons:

+ New	🖋 Edit	
Busines	s Case Folders	t
▼ 🗁 test 🍃 th	read	

Depending on the given rights, the user can:

- Create new folders and subfolders
- Delete folder and its contents (subfolders, Business Cases)
- Change the properties of the folder

Folder properties:

Settings of this Business Case folder thread	
Name of this Business Case folder	hread ×
Description of this Business Case folder	^
	~
Necessary security group to see and open this folder	0
	*
Necessary security group to edit/delete this folder	^
	×
Necessary security group for running the included Business Cases of this folder and subfolders	^
	\checkmark
Necessary security groups with limited access to Business Cases of this folder and subfolders	^
	×
OK CANCEL	

The following properties can be changed:

- Name of the folder
- The necessary security group to open the folder
- The necessary security group to edit the folder
- The necessary security group to execute containing Business Cases
- The necessary security group to execute containing Business Cases with limited access (read only)

4 Description and normal mode

In the description mode most of the settings are explained briefly while the normal mode lacks these descriptions.

Example of the description mode:

	igs of database of	column OFF	FICE_ID			
Vidget type	Mapping & Other	Features	Visual	Help texts	Data output format	
Hiding						
	vidget in the editing area the then the user will not see the	s widget in the editi	ing area. If you	i use a constant val	itue then it will be used even it the widget is hidden.	
	vidget in the inserting area then the user will not see the	s widget in the inse	rting area. If y	ou use a constant v	value the it will be used even if the widget is hidden.	
Hide this v	ridget in edit and inserting ar	rea for all users				
The data t	ield is to be used, but not sh	own in insert and e	dilling area, op	itional security grou	up based. That means this widget can be hidden for certain user groups only.	
Read-only						
	in edit and inserting area for	r all users

Read-only	in edit area for all users		- 10-		
Read-only	in inserting area all users				
1000	ent as a label and don't disp				

The Designer is switching the mode by clicking the right side of the screen.

button on the

Database & E-Mail connections 5

5.1 **Database connections**

Supported databases 5.1.1

Apparo Fast Edit can read data from the following databases:

- Oracle •
- **Oracle Client**
- IBM DB/2 •
- IBM DB/2 Client •
- IBM DB/2 i (iSeries, AS/400)
- IBM DB/2 z via IBM DB/2 Client
- MS SQL Server (optionally using Windows Authentication)
- MySQL
- Teradata from Version V2R6 •
- Exasol •
- Informix
- SAP HANA
- SAP Sybase ASE and IQ
- Snowflake •
- Greenplum
- PostgreSQL •

As a technical access path JDBC type 4 is used or JDBC Type 2 for IBM DB/2 Client / Oracle Client.

5.1.2 **Buttons**

The following buttons are at your disposal:

• New

•

- creates a new database connection
- Test DB-Connections •
- is testing all selected DB connections
- imports DB connections from a file Import - exports all selected DB connections into a file
- Export

5.1.3 Creating a new database connection

 - Password password of the login

5.1.3.2 Settings of the tab ,Advanced'

Main Advanced Variable	es Security
Working schema	V
	The database schema that is used automatically. If left empty, the system will ask for it. In most cases, the schema name is expected in uppercase letters.
Additional optional connect parameters	V
	You can add here additional parameters for the JDBC connection. Format depends on selected Database type. Use format required by database vendor. e.g. encrypt=true; trustServerCertificate=false; or ?serverTimezone=UTC These parameters are used for opening the database connection.
SQL command	V
	This SQL command is executed directly after opening a database session and is helpful to define session settings like encrypting.
Optimize concurrent access	
	If enabled then Apparo is using additional techniques to prevent data overwriting between multiple parallel database user sessions. Using this feature is helpful if there are parallel user sessions that are working with the same data at same time. Before a data change is made an extra SQL select is made, to check if the data wasn't changed by other user in the meantime. If the data was changed in another session then the user is getting a warning message. This feature is working for non-primary key widgets only.
Data row locking	If enabled then Apparo is using row locking between multiple parallel user sessions. Using this feature is helpful if there are parallel user sessions that are working with the same data at same time. If an user is triving to update a row that is updated at same time in another user session then the user will see immediately an error message.
	behavior for Oracle. The user is seeing all data rows but the locked data rows are not editable and they have another background colour. behavior for MS SQL Server: if a data row is locked by another session then the user is seeing an error message and not all data rows.
	Without using this feature the Business Case is completely locked ("frozen") and the user can just close the window. The best solution in this case is to use auto-commit (see tab "Features"). Using this feature the lock possibility is decreased.
Use connection pooling	The connection pool is helpful for improving general performance. If opening a database connection need much time then it's helpful to generate a pool of connections automatically for Apparo and the database connections are reused again. If you are using Script Variables in the database connection then pooling is disabled automatically.
OK CANCEL	

The following settings can be made in the tab advanced:

Working schema

If entered then this schema will be used only and it can't be changed at Business Case design time.

Additional connect parameters

Optionally, database-specific connection parameters can be added here, e.g. ?serverTimezone=UTC etc.

SQL command

This SQL command is executed directly after opening a database session and is helpful to define session settings like encrypting.

Optimize concurrent access

If enabled then Apparo Fast Edit is using additional techniques to prevent data overwriting between multiple parallel database user sessions. Using this feature is helpful if there are parallel user sessions that are working with the same data at same time.

Before a data change is made an extra SQL select is made, to check if the data wasn't changed by other user in the meantime. If the data was changed in another session then the user is getting a warning message.

Use connection pooling

The connection pool is helpful for improving general performance. If opening a database connection need much time then it's better to generate a pool of connections and the database connections will be re-used again.

If you are using Script Variables in the database connection then pooling is disabled automatically.

Minimum pool size

Any positive value can be used. If zero is used then the size of connection pool is unlimited.

Maximum pool size

Any positive value can be used. If zero is used then the size of connection pool is unlimited.

Reconnect idle database session after (sec)

If this is a number greater than 0, pooling system will test all idle connections in the pool, every this number of seconds. Setting a fairly long value (hours), is an excellent, high-performance approach. The testing is done by executing a metadata select into the database, therefore low values may slow down the application performance.

Discard idle database sessions after (sec)

Seconds a connection can remain pooled but unused before being discarded.

Zero means idle connections never expire.

If this number greater than 0, pooling system will close and remove from pool all connections that are idle for this number of seconds.

Low values may slow the application performance. Normally this value should be set to several hours.

Max idle time of excess connections (sec)

Some users want their pools to release quickly unnecessary connections after a spike in usage that forced a large pool size.

You can achieve this by setting here a value much shorter than above, forcing connections over your set minimum size to be released if they sit idle for more than a short period of time.

Database session increment

This number must be greater than 1, determines how many connections at a time the pooling system tries to acquire when the pool is exhausted.

Maximum number of total cached statements

Defines the total number of prepared statements a database connection will cache. The cache will destroy the least-recently-used prepared SQL statement when it hits this limit.

Maximum number of cached statements

Defines how many statements each pooled connection is allowed to own.

5.1.3.3 Variables

ain Advanc	d Variables	Security		
ery Business Case	used in following properti	ase connection can use	e the variables of the database connection too.	
ie connection pool w	be automatically disable	ed on connections that us	se variables.

Variable nam No user defined va Internal variabl Variable name	e ables found as ready for use E%>		Current date and time The number of milliseconds since 1.1.1970 (UNIX timestamp) Name of currently logged user Unique login name of currently logged user	Variable ty;

You can make database connections dynamically, using variables.

You have the ability to create your own JavaScript-based variables and have access to a selection of predefined variables.

5.1.3.4 Automatic tables/columns creation

Main	Advanced	Variables	Automatic tables/columns creation	Security
Type 1: I Type 2: I Type 3: I	can define the type t can read and write t combines type 1 an t can create new data ere to watch the vi	data only d 3 and is used to o abase tables and co	reate DB-tables or DB-columns in the Designer. Needs	ds a predefined type 3 connection.
🖌 Th	is database conne	ction type is useal	ble for creating/editing Business Cases (reading a	and writing of data in existing tables) only
🔵 Th	is database conne	ction type combin	es both types and should be used if users shall be	be able to auto create tables/columns (needs a predefined connection for creating new tables/columns
) Th	is database conne	ction type is used	for creating new database tables/columns only (ca	(cannot access data in Business Cases)
OF	CAN	ICEL		

If for the current client this function is activated (see client settings), you will see these options.

A connection for creating new database columns or tables, it requires to have the CREATE right granted. This database connection will be no longer used during the runtime of Business Cases.

Basically there are three types of DB connections:

- Database connections for reading and writing data
- Database connections for creating tables and columns
- Database connection that combines both types

5.1.3.5 Security

If not everybody should be able to use this database connection then it is possible to restrict access to specific designer users.

Add all security groups that shall be able to use these database connections. If these settings remain empty, then everybody can use this database connection.

6 Database transaction handling using OK/STORE/CLOSE/CANCEL buttons

All database changes are done in a database transaction.

You can define the transaction behaviour for a Business Case with following setting:

If auto-commit is **enabled** then the data changes (inserts, update, deletes) are commited as soon as possible. That means database locks will disappear as soon as possible and the data is readable using different database session too. It is not possible to make a session rollback.

If auto-commit is **disabled** then there will be no automatic commit.

If the user wants to commit explicitly the data changes, then it is possible to enable a **STORE** button that is making a commit.

Main settings	Available standard bu	Available standard buttons							
Standard buttons	Button type	Button label	Enabled	Order					
Filter data output	> OK	ОК	*	+ +					
Variables	> Store	Store		+ +					
Inserting of new data rows	> Cancel	Cancel	~	+ +					
-	> Close	Close	✓	+ +					
Editing of data rows	> Excel export	Export to Excel	×	+ +					
Excel import	Import copy&paste	Excel Row-Import	~	+ +					
Excel export	> Help	Help		* *					
Data history	τοιμ	lielb							

6.1 OK-Button behaviour without the CLOSE-Button

Using auto-commit:

With pressing the **OK**-button all data changes in the Business Cases are stored into the database table including commit. The Business Case is closed too.

Using no auto-commit:

With pressing the **OK**-button all data changes in the Business Cases are stored into the database table without commit. Without a **CLOSE**-Button the Business Case is making a commit and will be closed too.

6.2 OK-Button and CLOSE-Button behaviour

Using auto-commit:

With pressing the **OK**-button all data changes are stored in the database table including a **COMMIT.**

With pressing the **CLOSE**-button all data changes are stored in the database table with a following **COMMIT**. After that the Business Case is closed.

Using **no** auto-commit:

With pressing the **OK**-button all data changes are stored in the database table.

With pressing the **CLOSE**-buttons there is a **COMMIT**. After that the Business Case is closed.

6.3 Behaviour of the CANCEL-Buttons

Using auto-commit:

With pressing of the **CANCEL**-button the Business Case will be closed. If there is no **CLOSE/OK**-button then the Business Case is closed after that.

Using **no** auto-commit:

With pressing of the **CANCEL**-button the database transaction is **roll backed**. That means all changes are dropped and the old values are still in the database table. If there is no **CLOSE/OK**-button then the Business Case is closed after that.

6.4 CLOSE-Button in an embedded Business Case

If a Business Case is **embedded** in a report or dashboard then the **CLOSE**-button is **hidden** automatically and the **CANCEL**-button is **not closing** the Business Case.

7 Table Business Cases (Table BC)

7.1 Definition

- In a table BC all records of the target table are displayed in the browser window.
- All individual elements on the form are so called widgets e.g. Input fields, check boxes, buttons, etc
- The navigation buttons can be used to scroll through the records page by page.
- This representation makes it possible to effectively carry out changes within a database table.

Example for a Table BC:

ta Quality Demo											
e row validation checks	ks (independently from t	he kind of data Ir	sertion:								APPARO

Business Case selection

Following, the general settings for the Business Case :

Please provide a unique short name (ID), a name and select the target table. The description is optional and can contain declarations, release notes, or other information.

If multiple database connections are set up, this selection is automatically extended by the points 'database connection' and 'database schema'. The use of variables is allowed.

7.4 Business Case features

🔥 Features

The features of a Business Case open automatically after creating a Business Case .

If the Business Case is opened later for editing again, you can open the feature selection with the button on

Please select all features that you want to use in this	Business Case:	
nsert/delete/update/copy	Actions and scripts	
Inserting of new data rows	 Widget data calculations 	
 Editing of data rows 	✓ My own action buttons	
 Deleting of data rows 	Automatic scripts and database procedures	
 Bulk data update 	Other	
Copying of data rows	Refreshing data	
Excel	My own database error messages	
Excel import	 Filtering 	
Excel export	 Data transaction handling 	
Data quality	Access control	
Data row validator	Security	
Checking primary key	 Limited access (readonly mode) 	
Data change history		
 Auditing of data changes 		
Data history		

The features are divided into seven sections. The various features can be enabled or disabled as needed. If a feature is activated, then the selection menu in the Business Case edit view will be extended accordingly.

The advantage of this activation is obvious, if the Business Case isopened for editing again after some time, then you can see with one look at the menu, which features are used in this Business Case.

7.4.1 Features areas and features

• Insert/delete/update/copy

- Inserting of new data rows
- Editing of data rows
- Deleting of data rows
- Bulk data update
- Copying of data rows
- Excel
 - Excel Import
 - Excel Export

• Data quality

- Data row validator
- Checking primary key
- Data change history
 - Auditing of data changes
 - Data history

• Actions and scripts

- Widget data calculations
- My own action buttons
- Automatic scripts and database procedures

• Other

- My own database error messages
- Filtering
- Data transaction handling

Access control

- Security
- Limited access

A detailed description of the functions can be found in the section Business Case features.

7.5 Edit view of the Business Case

The edit screen is divided into two areas:

Menu bar, the buttons on the controller and all activated functions as menu items contains.

Buttons:

- Start saves all changes and starts the Business Case
- Close saves all changes and closes the edit view
- Save saves all changes
- Cancel discards any unsaved changes and closes the Business Case

Settings area, contains settings for the various functions and optionally divided again into tabs.

7.6 Business Cases settings

7.6.1 Main settings

The main settings are divided into several tabs and are containing the settings of the data source and the optics of the Business Case. Above all, it contains the widget settings.

Widgets are the actual control and output elements of a Business Case. This can be a filter, input or selection fields, buttons and more.

Because of their importance are Widgets the first tab you see when you open the Main settings.

Run Close Save Cancel	Target table	Header Footer Visual C	Colours Widgets Row ordering	Link into Portal	🔥 Featur

Main settings, Widgets

7.6.2 Widgets

This chapter covers the central area of a Business Case.

Here you can have different widgets that are normally connected with the target table, positioned in different areas.

Each widget has its own individual settings.

7.6.3 Edit view

You can open the settings of an existing widget, by clicking on the column name or widget type:

Editing widgets						• •	• •	
	Column	Column name	Widget type	Title	PK	RO	н	NN
	1	> OFFICE_ID	> Lookup dropdown (for all tables)	> Office			~	
	2	> PRODUCT_LINE_ID	> Lookup dropdown (for all tables)	> Product line	~			

Depending on the type of widget has the edit view different options, divided into tabs.

Widget edit view for the type ,Input field'

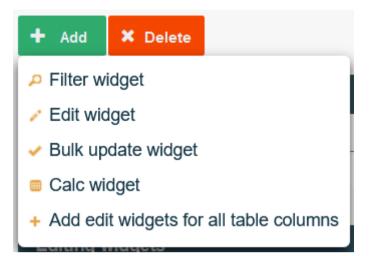

Widget edit view for the type ,Lookup dropdown (for all tables)'

7.6.4 Widget types and areas

When creating a new widget, you will first be asked for which area it is intended:

The option to add widgets for all database columns 'Add edit widgets for all table columns, is adding an 'input field' widget for each existing database column, if no widget is existing for this database column.

The corresponding areas for the widget types are:

- Filter area
- Edit area
- Bulk update area
- Calculation area

Based on the area for which the widget is thought, is there a selection of different widget types:

Input field - A standard entry field which allows the input of alphanumeric data Text area - A multiline entry area that allows formatted text Checkbox - Allows exactly two values, checked or not checked Simple dropdown (for target table only) - Based on data in the target table Lookup dropdown (for all tables) - Replaces numerical values with plain text from a 2nd table Simple multiselect - Select multiple values Lookup multiselect - Multiselect based on a lookup table Label - Enables you to output text Label with variables - Enables the output of text and values of variables Spacer & Title - To set up void spaces between individual widgets Business Case Link - To call e.g. detail BCs, data values are passed here File Upload/Download - To attach files to data rows

Business Case Link and File Upload/Download can only be used in the edit area.

Performance improvements necessary?

If your Business Case is using many lookup widgets and many data rows (20 data rows and more) in the editing area for a page then performance troubles can occur. That means the loading of the page need much time, the behavior of the browser is slow.

Solution:

See in tab "Visual" the setting "Performance mode".

If this mode is active then all lookup widgets in the editing area are displayed as labels with a pen icon. This output is much faster.

Run Close Save Cancel	Target table Header Footer Visual	Colours Widgets Row ordering Link into Portal	♣ Features
Main settings	Fixed widgets amount	3	
Standard buttons	Show max rows	20 .	
My own action buttons	Performance mode	Disabled	
Filter data output	Gap width between data columns(px)	Disabled	
Variables		Lookup widgets are optimized	
Inserting of new data rows	Gap width between data rows(px)	Date widgets are optimized Lookup widgets and Date widgets are optimized	
Editing of data rows	Show checkbox for select/unselect all data rows	<u>v</u>	TO NOT
Delete data rows manually	Hide application header		Show description
Bulk data update	Enable a general button bar for rich text widgets		tion
Excel import	Enable dialog window with error message in case of error		

7.6.5 Widgets in the Edit Area

The edit area in a Table Business Case (TBC) is mainly used for displaying data in list form and gives users the ability to edit the data.

Editing widgets											
Column	Column name	Widget type	Title	PK RO H NN							
1	> OFFICE_ID	> Input field	> Office								
2	> PRODUCT_LINE_ID	Lookup dropdown (for all tables)	> Widget in edit area								
3	> PRODUCT_ID	Lookup dropdown (for all tables)	> Product								
4	> accept_yn	> Checkbox	> Accept yn								
5	> SALES	> Input field	> Sales								
6	> STATUS_ID	Lookup dropdown (for all tables)	> My status								
7	> STATE_REVISION_ID	Lookup dropdown (for all tables)	> Revision status								
8	> FORECAST	> Input field	> Amount/Year								
9	> FORECAST2	> Input field	> Quarter I

In the edit area you can choose between these types of widgets:

- Input field A standard entry field which allows the input of alphanumeric data
- Text area A multiline entry area that allows formatted text
- Checkbox Allows exactly two values, checked or not checked
- Simple dropdown (for target table only) Based on data in the target table
- Lookup dropdown (for all tables) Replaces numerical values with plain text from a 2nd table
- Label Enables you to output text
- Label with variables Enables the output of text and values of variables
- Spacer & Title To set up void spaces between individual widgets
- Business Case Link To call e.g. detail BCs, data values are passed here
- File Upload/Download To attach files to data rows

7.6.6 Special functions in the widget settings

There are some special functions in the widget settings:

7.6.6.1 Reading and writing expressions

Reading and writing expressions allow the usage of SQL to manipulate data before it is shown to users or stored to the database.

Widget setting	gs of database	column OF	FICE_ID						
Widget type	Mapping & Other	Features	Visual	Help texts	Data output format				
Column name		OFFICE_ID			a 2				
Enable expressions		 Read expression 					х		Show des
		Write expression					X		description
		🖌 🕹	he used read a	and write expressio	ns having an inverse behaviou	r			

Variables are allowed here.

Common examples for expressions are:

TRIM()	 Removes spaces from strings
UPPER()	- Turns all letters into upper cases
LOWER()	- Turns all letters into lower cases

7.6.6.2 Conditional options

Many functions can be controlled with reference to conditions.

Thus, there are e.g. for the function ,Hidden', which hides a widget for the user when activated, several options.

Widget settin	ngs of database o	olumn OF	FICE_ID		
Widget type	Mapping & Other	Features	Visual	Help texts	Data output format
Hiding					
Hide this w	vidget in the editing area				
Hide this w	vidget in the inserting area				
✓ Hide this w	vidget in edit and inserting ar	ea for all users			
		all users			-
		selected	security group	os	
Read-only			e returns true		
Read-only	in edit and inserting area for	all users		*	
Read-only	in edit area for all users		*		
Read-only	in inserting area all users				
Show cont	ient as a label and don't disp	lay the widget fra	me and read-o	only colour	

For all users

This option is set by default. It hides the widget for all users.

For selected security groups

This hides the widget, but only for users who are member of one of the entered user groups. Other users can see the widget.

Hiding			
Hide this widget in the editing area			
 Hide this widget in edit and inserting area for 	selected security groups	-	Specify settings for security group

Hide the widget for the selected user groups

Widget security groups definition - Hidden

Existing security groups	
Security group

Add new security group	
Security group	
Group_B	ADD SECURITY GROUP

Security group editor

For a specific value

The option applies here as soon as the value of one of the columns in the target table in the corresponding data row matches with the stored value.

In our example, the widget would be hidden once in a data row in the product line column the value '3' appears.

Hiding			
Hide this widget in the editing area Hide this widget in the inserting area			
✓ Hide this widget in edit and inserting area for specific value	PRODUCT_LINE_ID	 has value 	3

The values can also be configured dynamically by using variables. <%VARIABLE%>

7.6.7 Widget settings for the example ,Input field'

Each widget type has its own settings. The following settings using the example of the widget type ,input field' can be found in almost all widget types. Distinctive features of each widget type are described in the following chapter ,More widget settings'

Widget type	Mapping & Other	Features	Visual	Help texts	Data output format
Input field		Input field:	Simple input f	ield with one line.	
Text area					
Checkbox Simple drondox	wn (target table only)				
 Lookup dropdo 					
Multi select lool	kup				
Label					
 Label with varia Spacer & Title 					
Business Case					
File upload/dov	vnload				

7.6.7.1 Mapping & Other

Widget settings of database column OFFICE_ID

Vidget type	apping & Other	Features	Visual	Help texts	Data output format			
olumn name	c	FFICE_ID						
able expressions								
lt value	1					V for all users		
	De	Use English For date use	format to define format YYYY	at be the lookup ke le numeric values (MM-DD e.g. 2020- YYYYY-MM-DD Hour	e.g. 1000.13)	-31 23:59:59		
onstant value	D)o not use constar	nt value			*		
ariable for using cont	ent in detail BC							
ок	CANCEL							

Column name

Here you can select the database column that is connected to this widget. The widget is reading the content of the column and is writing to this column. It is possible to use a variable in this column name too.

Default value

If you define a default value (using a variable is possible too) then the user will see this value in this input field in the inserting area. It is possible to define different default values for different user roles/groups. Use English format to define numeric or date values. Default value of lookup widget must be the lookup key value.

The function ,constant value' has the following options:

Default value	V for	all users 🗸
	If you define a default value (using a variable is possible too) then the user will see this value in th Default value of lookup widget must be the lookup key value.	all users selected security groups
	Use English format to define numeric values (e.g. 1000.13)	Science Security groups

You can set different default values for different user groups.

Constant value

A constant value is a value that will be always used for this widget. Even if the widget is hidden, read-only or if the user is inserting a value, then the constant value will be used. It is possible to define different constant values for different user roles/groups.

The function , constant value' has the following options:

Do not use constant value
Do not use constant value
Use constant value in insert case only
Use constant value in insert and update case
Use constant value in insert case if variable returns 'true'
Use constant value in insert and update case if variable returns 'true'

Variable for using content in detail BC

If this Business Case has a widget of type 'Business Case Link' for opening a detail Business Case , it is possible to define a variable that contains the value of the current widget.

The detail Business Case can use this report variable with the current value of this widget for example for output.

Important: In the detail Business Case you must define this report variable in tab "Variables" too.

7.6.7.2 Features

In the tab Features you can control the behavior of the widget in detail.

7.6.7.2.1 Hiding-Group

Includes options for hiding widgets.

Vidget type	Mapping & Other	Features Visual	Help texts	Data output format
Hiding				
Hide t	his widget in the editing are	ea for all users		-
_	his widget in the inserting a			
_				
Hide ti	his widget in edit and insert	ting area for all users all users		
Hide ti	he complete optical widg	selected se	curity groups I security groups	
			eturns true	

Hide this widget in the editing area

If enabled then the user will not see this widget in the editing area. If you use a constant value then it will be used even if the widget is hidden

Hide this widget in the inserting area

If enabled then the user will not see this widget in the inserting area. If you use a constant value then it will be used even if the widget is hidden

Hide this widget in edit and inserting area

The data field is to be used, but not shown in insert and editing area, optional security group based. That means this widget can be hidden for certain user groups only

Hide the complete optical widget column

If enabled then the user will not see the complete optical column of this widget including the label

7.6.7.2.2 Read only group

Includes options to disable the entering or changing of values in widgets

Read-only
Read-only in edit and inserting area for all users
✓ Read-only in edit area for all users
Read-only in inserting area all users
Show content as a label and don't display the widget frame and read-only colour

Read-only in edit and inserting area for

The data field cannot be altered in editing and inserting area but it is still visible with another background color, optional security group based.

Options:

all users	•
all users	
selected security groups	
if variable returns true	

Read-only in edit area for

The data field cannot be altered in editing area, optional security group based. Read-only widgets have an own background color.

Options:

all users	•
all users	
selected security groups	
if variable returns true	

Read-only in inserting area

The data field cannot be altered in inserting area, optional security group based.

Options:

all users				
all users				
selected security groups				
if variable returns true				

7.6.7.2.3 Not Null Group

Not Null		
Value is mandatory (not null) for	all users	*

Allows to enable mandatory values for:

all users	
selected security groups	
if variable returns true	

7.6.7.2.4 Aggregation group

Aggregation	
Show average	of this column in the footer
Language	Tooltip text
English	Average amount
German	Durchschnittlicher Betrag

Allows to show the following aggregations under the widgets

sum	
average	H
minimum	
maximum	

User's view

7.6.7.2.5 Other-Group

Contains all other settings

Other
 Database column is the primary key or a part of it Database column is computed by database (for example using a database trigger or auto-increment feature) Show a small icon for easier deleting of the complete content of this widget Value is mandatory (not null) Remove all spaces at the begin and at the end automatically Hide output in password style Store value in upper case
Store value in lower case

Database column is the primary key or a part of it

The widget is the primary key of the underlying table or is an part of the key (with combined keys). This definition is independent of the primary key definition in the database and at least one column must be defined as primary key. A primary key is identifying an unique data row of the target table/view.

Database column is computed by database (for example using a database trigger or auto-increment feature)

The database table column value is filled automatically by the database (e.g. with triggers, auto-increment field). Apparo Fast Edit is not changing this value in the target table.

Show a small icon for easier deleting of the complete content of this widget

Showing a small delete icon for deleting the widget content.

Value is mandatory (not null)

If a widget value is mandatory, the user must enter a value in this widget (or use a default or constant value). The definition of this behavior is independent of the definition of the target table column in the database.

If a filtering widget is mandatory, it is a good idea to define a default value for it as well. You will avoid some error messages when starting the business case.

Remove all spaces at the begin and at the end automatically

If enabled then all spaces at the begin and end are removed automatically before storing into database table

Hide output in password style

Entered characters are shown as dots only

Store value in upper case

If enabled then all characters are changed to upper case before storing into database table

Store value in lower case

If enabled then all characters are changed to lower case before storing into database table

7.6.7.3 Visual

In the tab ,Visual' you will find the header (column heading), and settings for the layout, and settings to limit the maximum allowed input length in this widget.

By default the maximum entry length is defined by the database column definition, for example Varchar(20) allows a maximum of 20 alphanumeric characters. This can be further limited by the input of an own value.

The layout can also be controlled by CSS.

To overwright global visual settings of the client settings, the lock symbol must be closed.

7.6.7.4 Visual help texts

Contains the settings for description and hint text

Widget settings of database column OFFICE_ID

Widget type	Mapping & Other	Features	Visual	Help texts	Data outpu	t format
Description	n text					
Language	Description text					
Spanish						V
German	Üblicherweise	werden solche V	Verte verstec	kt, zu Demozweck	en sichtbar	V
English	Normally hidde	n, for demonstra	ating purpose	es in this case visit	ble	V
Hint text						
Language	Hint te:	xt				
Spanish						V
German						V
English						V

Description text

This text can describe the widget and can be helpful for the user. You can add a more detail description text for each installed language.

The user is seeing this text if he is pointing to the label of this widget.

Hint text

The hint text is displayed only if the widget has no value. Is displayed in the input area in gray text, e.g. 'Enter date in the format: dd.MM.yy'

7.6.7.5 Data output format

Under data output format you will find several options for testing the validity of the data. The default setting ,Use type of output column data' provides no further adjustments. With this option, the definition in the database of the associated database column determines which data type is used.

Widget settings of database column OFFICE_ID						
Widget type	Mapping & Other	Features	Visual	Help texts	Data output format	
Output type		Number Camency Percentage Date / Time Text		e		
сĸ	CANCEL					

Output types:

•

21	22	23	24	25	26	27	
28	29	30					
Akt	Aktuelles Datum Schließen						

The date picker prevents entry mistakes.

7.6.7.5.1 Data Quality check

Custom validator Java 11 class

Widget type	Mapping & Other	Features	Visual	Help texts	Data output format	
Output type		Number Currency Percentage Date / Time Text Use type of	output column		•	
Decimal places		2				
Show separate gr	oups					
How to show neg	ative number	with minus s with minus s	ign ign and in red	colour		
Data quality c	heck					
Custom validator	Java 11 class			• 0		
Interval of old valu	ue (%)	ApparoStrir	ngValidator		v	

Widget settings of database column PLANNING_AMOUNT

Optional. A Java 11 class that is testing the input value. The file directory of this file is defined in the Apparo Configuration Manager. This class is called automatically before Apparo Fast Edit is updating or inserting this row.

Interval of old value (%)

Interval of old value (%)	Minimum allowed:	50
	Maximum allowed:	100

Hereby you limit the validity of the entered values based on the existing values.

Example: In the widget, the value is 100. In this case, users may only enter values between 50% and 100% of the original value, so values between 50 and 100. Otherwise, the user receives an error message.

Interval

Interval	Minimum allowed:	1000
	Maximum allowed:	2000

Limits the validity of entries based on an absolute interval. Permissible are values only from 1000 to 2000. Interval limits can be set dynamically with variables.

Regular Expression (Only for type ,Text')

Regular expression for data quality	* •	0
		-

Using a regular expression is useful to define more complex input rules. For example, you can specify that the first character must be an 'A' and then only numbers are allowed. Click the '?' icon to see the detailed instructions.

Characters						
Character	Description	Example				
Any character except [\^\$. ?*+()	All characters except the listed special characters match a single instance of themselves.	a matches a				
<pre>\ (backslash) followed by any of [\^\$. ?*+()</pre>	A backslash escapes special characters to suppress their special meaning.	\+ matches +				
\xFF where FF are 2 hexadecimal digits	Matches the character with the specified ASCII/ANSI value, which depends on the code page used. Can be used in character classes.	\xA9 matches © when using the Latin-1 code page.				
\n \n and \+	Match an LE character, CR character and a tab character respectively. Can be	\r\n matches a				

7.6.8 Special settings other widget types

7.6.8.1 Widget type Text area

For the type text area you will find an extra block of settings in the tab 'Visual'

Rich text edit	
	ext design like bold, underline, etc. ine and colour icons in HTML editor
Store as plain text into column	COMMENT_TEXT

Use HTML tags for flexible text design like bold, underline, etc.

With this feature the user can change the text style (for example bold, italic, colors underline,...). In this case the input text is stored including HTML tags.

Show just bold, italic, underline, and color icons in HTML editor If enabled then just the most important buttons for text style are displayed

Store as plain text into column

Optional it is possible to save the input text without HTML tags in another column of the same target table.

7.6.8.2 Widget type Checkbox

The additional options for this widget type, you will find in the tab 'Other':

- Value, if the checkbox is activated
- Value, if the checkbox is deactivated

🛃 Apparo Fast Edit				Busin	ess Case Designer - BC_Areas / Editing of data incl. quality
Widget settings of database	e column

							V	?		
							SYNTAX CHECK			
		• • •	/ & ^ - > < >	()						
Maximum numbe	r of options to display	1000	(0 = unlimited)							
ок	CANCEL									

Tab Lookup & Dropdown & Multiselect

Multivalue 'Order By'

The widget will display a list of values. With this setting the sorting order can be defined.

Items in multivalue will be sorted by:

- None no sorting for values (use default sorting order taken from database)
- Ascending Ascending Value Sorting
- Descending Descending Value Sorting

SQL where condition

You can filter the output of this widget using this setting. Usage of variables is possible. It is possible to filter the values of a lookup widget depending on the value of another widget.

Maximum number of options to display

This option determines number of dropdown options to be displayed. 0 = unlimited.

7.6.8.4 Lookup dropdown

The lookup dropdown behaves identically to ,simple dropdown', but the plaintext comes from another table

Widget settin	ngs of database co	humn					
Widget type	Mapping & Other	Features	Lookup & Dropdown & M	Itiselect Vis	ual	Help texts	Data output format
Database connec	don		SAMPLES				1
Lookup table			SAMPLE_PRODU	T,UNE			1
Lookup column fi	or join with target column		PRODUCT_LINE_	D			
			Use read expre	ision			
Looksp lable valu	re column for output.		PRODUCT_LINE_	WHE_ WALANGUA	E%+		1 C
			Use read expre	ision			
Multivalue 'Order'	DY		Ascending				
Lookup table sort	t column		Use same column	like for displaying th	evalue		
SQL where condi-	tion						
							6 3 *
			 Security group t 	ased filtering			
Accept the Looku Make values dist	p Key Value as import value t inst	too					
	r of options to display		1000	(0 - unlimited)			
	selected value which isn't in	the periodiable list o	fvalues				
- 04	CANCEL						

The lookup dropdown, compared with the simple dropdown provides other options:

Database connection

With the database connection you can define how the Lookup Dropdown (for all tables) can read the selectable values. All database connections are stored in "Database Connections".

Lookup table

The lookup table is a database table that has a mapping, e.g. 1=white, 2=blue, 3=yellow. In this case the number is the lookup key and the colour name is the lookup value. All possible and selectable values are stored in this database table/view.

Lookup table key column for comparing

The key column of the lookup table will be stored in the target table. This key column will be compared with the "Column Name" (see Mapping & Other). Be sure that both have the same data type. If you must compare both columns in a more flexible way then you can use the "Reading Expression"

Lookup table value column for output

The value column of the lookup table is used for displaying only. It will be not stored in the target table. If you want to change the output then it is possible to use "Reading Expression". Variables, like <%LANGUAGE%> are allowed. This would output the Label text in the users language by automatically chosing the right column (e.g. PRODUCT_LINE_NAME_EN or PRODUCT_LINE_NAME_DE)

Multivalue 'Order By'

The widget displays a list of values. With this setting, the sorting order can be set. Elements in the widget are sorted:

- None No sorting for values (use default sort order from database).
- Ascending Ascending value sort order
- Descending Descending value sorting

Lookup table sort column

Normally the output is sorted alphabetically, but it is also possible to use another lookup column for sorting.

SQL where condition

With this setting you can filter the output of this widget. The use of variables is possible. It is also possible to filter the values of a lookup widget depending on the value of another widget.

Security group based filtering

Allows different SQL where conditions for different user groups

Accept the Lookup Key Value as import value too

Lookups accept both values: lookup key value and lookup output value

Make values distinct

Make duplicate values unique:

If there are many output values with different filter values, all filter values are used for filtering when the user selects the unique output designation.

Maximum number of options to display

This option determines the number of drop-down values to be displayed. For all values, use 0.

Show an already selected value which isn't in the selectable list of values

Display a value that has already been selected, even if it is not in the current list of values (due to filter settings).

7.6.8.5 Widget type "Multi select lookup"

This widget type exists only in the edit area.

You can select many values which are stored in a detail database table.

Multi select lo	okup							
Color selection	Product line	Product					_	
thus		Selecting many v	alues					
velaw		QI					<u>^</u>	
			Available			Selected		
black		red			blue			
brown		green			yelow			
		white brown		PROPERTY				
		pink		black				
		T-B puprple						
		silver		*

7.6.8.5.1 Tables & Mapping

7.6.8.5.2 Database connection settings

COLOUR ID

Database connection

You can freely specify any database connection that will be used for this widget.

.

7.6.8.5.3 Lookup source table

Is used to translate stored IDs into clear text output. A color lookup table could look this way:

ID Text

- 1 green
- 2 red
- 3 silver

Settings

Source lookup table name

The source lookup table contains all possible values that can be selected

Source lookup table key-column

The ID/key column that identify a value

Source lookup table value-column

The column that contains the value that must be displayed

Source lookup table description column

The column that contains an optional description text

Source lookup table value sorting-column

The column that is used for ordering the list of values

Multivalue 'Order By'

The widget will display a list of values. With this setting the sorting order can be defined.

Items in multivalue will be sorted

None - no sorting for values (use default sorting order taken from database) Ascending - Ascending Value Sorting Descending - Descending Value Sorting

SQL where condition

An optional filter for lookup values

7.6.8.5.4 Lookup target table

This table stores the set values and could look like this:

Product line id	Product id	Colour id
2,00	60,00	4,00
2,00	60,00	2,00
2,00	70,00	6,00
2,00	70,00	7,00
2,00	440,00	1,00
2,00	480,00	10,00
2,00	480,00	8,00
2,00	480,00	3,00
2,00	480,00	9,00

Settings

Lookup table

All selected values of this multi select widget are stored into this lookup target table. The lookup target table contains for each row: the selected value (or key) and the primary key of the target table (that is the master table).

Join lookup table key(s) to target table

PK columns of this BC

Foreign key to lookup source table

This is the ID of the lookup table and will be stored along with the primary keys of the target table. For each selected value a new data row will be stored.

7.6.8.5.5 Widget behavior

Contains special settings only for this widget type.

Value filtering	
Max size of result set	1000 The max amount of the visible result set. This setting is helpful if you are working with a targe list of values.
Make values distinct	✓ Making double values distinct. Effects an more objoint values with different filter values are used for filtering if the user is selecting the unique output label.
List of values is very large, use own dialog	By on have a large list of values then it is possible to use an own window for better overview.
User can filter values	If anabled then the user is seeing a filter possibility. This is helpful if there are many-values.
Minimum text length to filter values	2
Load data automatically when dialog is shown	Chi feature is height if your list of values is very large
Show checkboxes for easier selection	Show checkbores for easier selection
Dialog window width (px)	800
Dialog window height (px)	400

Value filtering

Max size of result set

The max amount of the visible result set. This setting is helpful if you are working with a large list of values.

Make values distinct

Making double values distinct:

If there are many output values with different filter values then all filter values are used for filtering if the user is selecting the unique output label.

List of values is very large, use own dialog

If you have a large list of values then it is possible to use an own window for better overview.

User can filter values

If enabled then the user is seeing a filter possibility. This is helpful if there are many values.

Minimum text length to filter values

Load data automatically when dialog is shown

This feature is helpful if your list of values is very large

Show checkboxes for easier selection

Dialog window width (px)

Dialog window height (px)

7.6.8.6 Widget type ,Simple & Lookup multiselect'

This widget type exists only in the filter area. User can select multiple values simultaneously.

Usually, the settings are identical to those of the widget ,dropdown'

The specific settings for this widget types can be found in ,Visual'

Number of visible rows	2	*
------------------------	---	---

Visual Settings

Number of visible rows

Here you can set the number of displayed choices that appear without scroll bar. The default is a widget size of 8 lines.

And in Lookup & Dropdown & Multiselect

Show only choices used in target table	Lé a mala

If enabled then only values that are used in target table will be shown as selectable dropdown options.

Show only choices used in target table

If enabled then only values that are used in target table will be shown as selectable dropdown options.

7.6.8.7 Widget type 'Label with variables'

This type of widget provides no direct way to assign a database column.

Widget setting	gs							
Widget type	Mapping & Other	Features	Visual	Help texts	Data output format			
Label value		Label	text <%city%	ə		10		
Hide value of this	nidget if used variable is	empty						
OK	CARCEL							

Special options for label with variables:

Label value

Usually contains Text and variables. HTML and all variables can be used in this field.

Hide value of this widget if used variable is empty

If one variable does not return a value, then the output is completely blocked

7.6.8.8 Widget type Business Case Link

This type of widget is used to link multiple Business Cases. With a hyperlink in each row, you can e.g. display details in another Business Case.

Mapping & Other

Widget setting	gs								
Widget type	Mapping & Other	Features	Visual	Help texts					
Select the detail B	Business Case that must				BC_Areas2		Widgets of master Business Case	P. C.	
		PRODUCT_ID		noj proporti or a		is mapped to	PRODUCT_ID		-
ок	CANCEL								

In 'Mapping & Other' you can choose a Business Case and assign a primary key. The primary key mapping is used to filter the called Business Case . Not assigned data is displayed unfiltered.

Features

Other
Display the detail Business Case in the same window like the current Business Case

In Features you will find another option. The default is to open the called Business Cases in a separate browser window. If this function is enabled, the called Business Case opened in the same browser window. If the called Business Case isclosed, then the calling Business Case is opened again.

Visual

Visual settings

In addition to the general options there are further options for this widget type in tab ,Visual'

Window title

All variables can be used in this input field Contains the window title name for all defined languages.

Hyperlink title

All variables can be used in this input field Contains the name of the shown hyperlink

Detail window width (px) & Detail window height (px)

This property is used to setup the size of the browser window, which shows the called Business Case . You can use JavaScript language to resolve window parameter. If you use number, quote it with single quote mark e.g. '540'

Detail window left (px) & Detail window top (px)

Defines the location of the browser window (in pixel) from the left or the top of the screen.

7.6.8.9 Widget type File Upload/Download

This type of widget is used to attach files to data rows. It is possible to execute scripts and forwarding the file to an existing DMS.

Special Variables of this type are:

<%UPLOADED_FILE_NAME%>	Name of the uploaded file
<%DISPLAY_FILE_NAME%>	Name of file as diplayed
<%DELETED_FILE_NAME%>	Name of the deleted file

There are 2 ways to store files:

File storage type This can be selected with this radio button (Database or File system)

Database - Files will be stored in the database. (Supported: Oracle, IBM DB2, IBM dashDB, MS SQL Server, PostgreSQL, MySQL and and SAP HANA)

The unique setting for storing in the DB is:

Column for storing file content

Database column where file will be stored. Supported types of the column are:

- ORACLE: BLOB
- IBM DB2: BLOB
- MS SQL SERVER: BINARY, VARBINARY
- PostgreSQL: BYTEA

File system - Files will be stored on the server filesystem:

Mapping & Other

Widget type Mapping	& Other Features Actions Visual Help texts	
File storage type	File system - Files will be stored on the server filesystem	
	Database - Files will be stored in the database. (Supported databa	ises: Oracle, IBM DB2, IBM dashDB, MS SQL Server, PostgreSQL, MySQL and

ile name mask ile directory path	Hed If selected then file will be copied too when data row is copied. * Using this mask the user can uplead files with defined name parts only, e.g.* doc = file	$ \mathbf{N} $ is with docentension only or ".jog." img means jpg and img files are allowed only
Copy file when data row is cop File name mask File directory path Maximum allowed file size	Hed If selected then file will be copied too when data row is copied. * Using this mask the user can uplead files with defined name parts only, e.g.* doc = file	W is with doc extension only or "grg." (mg means jug and img files are allowed only, $ W $.

Column for storing file name

OK CANCEL

DB column for storing the file name as set in the file name mask

Column for storing display name

DB column for storing the display name as set in the display name mask, usually the uploaded file name

File name template

The name of the uploaded file can be changed using the file name template.

Display name template

The name of the uploaded file can be changed using the display name template.

File name mask

Using this mask the user can upload files with defined name parts only, e.g. *.docx = files with .docx extension only. .excel allows all Excel types(csv, xls, xlsx) Variables and wildcards (%, *, ?) are allowed.

File directory path

Path where the uploaded files are stored. Apparo Fast Edit must have read/write rights for this file directory. Every "File Upload/Download widget" should have a unique directory path. Network pathes are allowed <u>\\Server\Path\To\Folder</u>, access rights are necessary.

Maximum allowed file size

Using the maximum allowed file size (MB) you can limit the file size for uploading. 0 = all file sizes are allowed.

Tab ,Actions'

After uploading the file, it is possible to start an action. This is useful when using a document management system.

Options:

- Enable action after file upload
- Enable action before file download
- Enable action after file delete action

Actions

- Executing JavaScript commands
- Executing SQL commands
- Running a DB procedure
- Executing an anonymous block (acts like a stored procedues)
- Running a script (batch file, SQL or JavaScript file)

German	Button für ausführbare Date	V	Bitte warten	V Das	Skript wurde beendet	V
English	Executable Button	V	Please wait	V The	script has finished	V
ок	CANCEL					

7.7.2.2.4 Features

Here you can define the behavior of the button.

My own action button

General settings	Dialog visual	Information texts	Features					
Refresh Business Cas Show process output	se data after finish							
Hidden for		> Specify settings for security group						
Execution mode		Execute the script/procedure/email once						
Send eMail after exec	ution							
ок	CANCEL							

Refresh Business Case data after finish

If enabled, the Business Case isreloading the database data again after execution of the script/procedure. This is helpful if your script/procedure is changing data that must be displayed in the Business Case too.

Show process output

If enabled, the user will see the script output in a small window.

Hidden for

Hides the button for defined user groups

Execution mode

Execute the script/procedure/email once Here you can define the exact behavior of this button. Your script/procedure can be called for each row, selected row or just once.

Execute the script/procedure/email once

Execute the script/procedure/email once

Execute the script/procedure/email for all rows of the current page only

Execute the script/procedure/email for each row of all pages

Execute the script/procedure/email for each already selected row only

Send eMail after execution

After execution of a script or database procedure it is possible to send automatically an eMail. This eMail Business Case has access to all widget values of this Business Case .

That means that the eMail body can contain values of this current Business Case .

7.7.2.3 Database procedure button

My own action b	utton			
General settings	Dialog	y visual	Information texts	Features
Database connection		SAMPLES	5	
DB procedure call exp	ression	demo_cha	ange_status(<%city%>)	
Return value variable Placement Gap (left)		<%RETUR Right 4	RN_VALUE%>	
ок	CANCEL			

Database connection

Here you can select the database connection on which the button will be proceeded.

DB procedure call expression

How to call a database function or procedure:

[Calling convention] procedure/function_name (argument1, argument2, ..., argumentN)

Please use same character cases for schema and procedure/function like defined in your database.

If the database connection of this procedure/function is same as the one for Business Case than the procedure/function is executed within the same database transaction.

The procedure must not commit or rollback the existing transaction, but is allowed to start its own inner (named) transaction (if supported by database) or use savepoint's.

For character or string argument use ' character to enclose argument. Use at least one space between [Calling convention] and procedure name.

Your parameters may contain Apparo Fast Edit variables, for example: <%USER_NAME%> Do not enclose Apparo Fast Edit variables with apostrophes or quotes.

Oracle or IBM DB2 database:

return - For calling a stored function that returns a value

MS SQL Server database:

Calling functions on SQL Server is not supported. It is possible to have a return value from procedure but [Calling convention] must be empty in this case.

Please use in your SQL Server procedure at the begin "SET NOCOUNT ON;" Then it is possible to use SQL commands in your procedure without having impact to the return value.

Sybase database: select - For calling a stored function that returns a value

Teradata database:

return macro - For calling a Teradata macro that returns a value **macro** - For calling Teradata macro that does not return a value **return** - For calling a stored functions that returns a value

Return value variable

In this variable is the return of the function/script stored.

Placement

Here you can decide about the arrangement of buttons on the screen.

Gap

Space to the next button in pixel

7.7.2.4 URL buttons

With these buttons you can call any URL:

- Web Sites & Portals
- Reports & Dashboards
- Business Cases

My own action b	ly own action button						
General settings	Dialog visual	Information texts	Features				
URL	http://goo	gle.it					
Placement Gap (right)	Left	*					
ок	CANCEL						

7.7.2.5 E-mail Buttons

With these buttons you can send e-mails.

General settings	Dialog	visual	Informa	tion texts	Features
Email settings			Email_BC re_Detail_Se	ndMail	
Placement		Left		-	
Gap (right)		4			

The settings for the e-mail you make in the selected e-mail Business Case . All variables of the calling Business Case can be used.

7.7.3 Filter data output

The function filter data output represents the global filter of the Business Case. Additional filters can be added through filter widgets.

Filter data output	#- Features
The SQL filter conditions are filtering data rows of the target table for the output.	
CURRENT_FLAG=1	∞ ?
	SYNTAX CHECK
• • • / <u>4</u> <u>1</u> <u>* 11</u> * 2 2 2 2 2 2 2 2	
> security group based intering	

You can create different filters for different security groups. If a user is a member of the security group, only the security group based filter is used instead of the global BC filter.

Variables are allowed.

Syntax

In the filter, you can use native SQL. It represents the Where clause of the SQL query and filters the output of the target table.

Example

SELECT * FROM target table WHERE [=data output filter]

7.7.4 Filter widgets

Contains the optical settings for the additional filter page and the settings for combining filter widgets

7.7.5 Combine Widgets with AND/OR

The function extends the filtering possibilities with filter widgets.

Filter widgets	🔥 Features
Combine Widgets with AND/OR	
Search Expression	
<%SEARCH_VALUE_PRODUCT_LINE_ID%> OR <%SEARCH_VALUE_PRODUCT_ID%>	
	*
<%SEARCH_VALUE_PRODUCT_ID%>	

Standard type of searching is combining all used searching widgets with logical 'AND' operator. If you want to combine them differently then you must use 'Advanced Type Of Searching'.In 'Search Expression' you can define your own combination of searching widgets. You can combine them with operators 'AND' and 'OR' and you can also use brackets '(' and ')'

Each searching widget must be used exacly once in the search expression.

The following examples contain combinations of these four filters widgets

Examples

One of the set criteria is met:

<%SEARCH_VALUE_PRODUCT_ID%> or <%SEARCH_VALUE_PRODUCT_COLOUR%> or <%SEARCH_VALUE_PRODUCT_SIZE%> or <%SEARCH_VALUE_PRODUCT_LINE_ID%>

The product line and ONE of the other filter criteria is met:

<%SEARCH_VALUE_PRODUCT_LINE_ID%> and (<%SEARCH_VALUE_PRODUCT_ID%> or <%SEARCH_VALUE_PRODUCT_COLOUR%> or <%SEARCH_VALUE_PRODUCT_SIZE%>)

The product line or the combination of ALL other filter criteria are met:

<%SEARCH_VALUE_PRODUCT_LINE_ID%> or (<%SEARCH_VALUE_PRODUCT_ID%> and <%SEARCH_VALUE_PRODUCT_COLOUR%> and <%SEARCH_VALUE_PRODUCT_SIZE%>)

7.7.6 Variables

Syntax: <%Variable_name%>

User defined variables	Internal variables		🖡 Features
+ Add X Delete			
User defined variables			
Variable name			Variable type
> <%bulk_text%>			Script variable
> <%city%>			Script variable
> <%NextID%>			SQL variable (target table)
Variables for used filte	r widgets		
Variable name		Variable description	
<%SEARCH_VALUE_PROD	UCT_ID%>	Value of filter widget mapped to PRODUCT_ID column name	

Basically, there are user-defined variables and internal variables.

Apparo Fast Edit supports 6 different types of variables:

Internal pre-defined variables Operating system environment variables Script variables SQL variables Report variables Widget reference variables

Variables can be used in practically all settings and other variables

In Business Cases, you can create these types of variables:

Select the typ	e of new variable	×
JS	> Script variable	You can use JavaScript to compute advanced calculations and the result can be used in Apparo as any other variable. The execution is done server side only.
REPORT	> Report variable	Report variables: They are used to deliver content to a Business Case using the URL e.g. from a report or to deliver the content of a widget from one Business Case to another one.
SQL	> SQL variable (for all tables)	SQL variable to execute commands on all tables. Every time the SQL variable is used then the defined SQL is executed. The variable content is the first column of the first row of the executed SQL. You can use the variable (e.g. <%current_year%> in many input fields of the Business Case definitions, e.g. in header text, default value, constant value and so on.
SQL	> SQL variable (for target table only)	SQL variable for Business Case target table only.
CANCEL		

7.7.6.1 Use of variables in the Designer

Many widget settings can be made dynamic with variables.

Examples:

Variables in lookup definitions

Lookup column for join with target column	PRODUCT_LINE_ID	•	
	Use read expression		
Lookup table value column for output	PRODUCT_LINE_NAME_<%LANGUAGE%>	•	
	Use read expression		
a accordiated database solumn is compased of Name, "and the return value of the language used			

The associated database column is composed of, Name_ 'and the return value of the language used. German users are assigned to the column NAME_DE and English users to the NAME_EN column

Variables in labels, hint texts, the header and footer

Column label			
Language	Column label		
German	<%LABEL_DE%>	V	
English	<%LABEL_EN%>	V	

In this example, the heading of the column is output by variables

Variables in filter definitions

SQL where condition		
	PRODUCT_LINE_ID = <%PRODUCT_LINE_ID%>	0

Dynamic SQL filter

v **?**

Variables in variables and in the data row validator

An example for the use of variables in the data row validation:

Data row validation

In this example widget reference variables, SQL variables and internal variables have been used

```
1 var result;
2 if(<%LANGUAGE%>=='en')
3 {result = 'Message text';}
4 else
5 {result = 'Nachrichtentext' ;}
6 result;
7
```

In this example, an internal variable is used in a JavaScript variable

ta output format	
ere PRODUCT_ID = <%PRODUCT_ID%>	⊻ ?
	ere PRODUCT_ID = <%PRODUCT_ID%>

Widget reference variables are often used in SQL variables. JavaScript variables are also possible.

An example, for the use of dynamic variables as interval:

In a widget of type "input field", the permissible range of values is restricted:

Interval	Minimum allowed:	<%MIN_INTERVAL%>	
	Maximum allowed:	<%MAX_INTERVAL%>	

Example of dynamic intervals that restrict the values input by calculations.

Dynamic values are realized via variable:

Our SQL variable is of type SQL variable (target table only). This has the advantage that automatically all user-group-dependent filters are used.

The current line is identified by the value in the widget PRODUCT_ID. That PRODUCT_ID is a primary key.

The following sample SQL for SQL variable would be possible:

SELECT min_value FROM target_table WHERE product_id = <%PRODUCT_ID%>

In this case, <%PRODUCT_ID%> refers to the widget PRODUCT_ID in the Business Case and returns the current value.

The SELECT returns the value min_value of the current line and stores it in the new SQL variable "VAR_MIN_CALC ".

The SQL is executed every time when accessing the variable "VAR_MIN_CALC".

7.7.6.2 Internal variables

Variable name	Variable description
<%AFE_HOME_DIR%>	Folder on the server which contains AFE settings
<%AFE_CLIENT_ID%>	Contains the client ID of the current client
<%AFE_BC_NAME%>	Name of currently opened Business Case
<%AFE_BC_ID%>	ID of currently opened Business Case
<%AFE_BC_FOLDER%>	The Designer path of this Business Case
<%SERVER_NAME%>	Name of server where Apparo Fast Edit is running
<%USER_NAME%>	Name of currently logged user
<%USER_LOGIN%>	Unique login name of currently logged user
<%USER_EMAIL%>	Email address (in upper case) of currently logged user
<%LANGUAGE%>	Identifier of language in which user interface is displayed
<%NEW_UNIQUE_VALUE%>	Unique value (everytime variable is resolved, its value will be unique)
	Returns content of the file as a string. Syntax is:
<%FILE_CONTENT%>	<%FILE_CONTENT(C:\myFile.txt)%>
<%CURRENT_DATE%>	Current date and time
	Current date in the format "yyyy-MM-dd 00:00:00.000" e.g. "2021- 02-28 00:00:00.000". This variable can be used for comparing with
<%CURRENT DATE STANDARD%>	widget reference variables of type date.
	Current date and time in the format "yyyy-MM-dd HH:mm:ss.SSS"
	e.g. "2021-02-28 14:51:45.456". This variable can be used for
<pre><%CURRENT_TIMESTAMP_STANDARD%></pre>	comparing with widget reference variables of type date+time.
<%DATE%>	Current date
<%DATE_ISO%>	Current date formatted according 'yyyy-MM-dd' format
<pre><%DATE_TIMESTAMP_SHORT%></pre>	Current timestamp for file names etc.
<%TIMESTAMP%>	Current date and time
<%TIME_MS%>	The number of milliseconds since 1.1.1970 (UNIX timestamp)
<%CURRENT_TARGET_TABLE_NAME%>	Name of the current target table
<%PRIMARY_KEY%>	The primary key of current row
<%PRIMARY_KEYS%>	Comma delimited list of the used primary keys
<%ROW_EDIT_TYPE%>	Type of data modification. Output is of type string
<%SELECTED_ROWS_COUNT%>	This variable is helpful for output e.g. "Are you sure you want to delete X rows?"
<pre><%SELECTED_NOWS_COUNT/%> </pre> <%ROWS%>	Count of current visible rows
<pre><%BULK_UPDATED_ROWS%></pre>	Count of all updated rows
<pre><%INSERTED ROWS%></pre>	Count of all inserted rows during Excel import
<pre><%UPDATED ROWS%></pre>	Count of all updated rows during Excel import
<%IMPORTED_ROWS%>	Count of all imported rows during Excel import
	Contains current count of Excel columns of current Excel row of Excel
	import with copy & paste. This count is calculated for every Excel
<%EXCEL_IMPORT_COLUMNS_COUNT%>	data row.
<%IMPORTED_FILE_NAME%>	Name of the currently imported Excel file
	Universally unique identifier (UUID) of type String of each Excel
<pre><%EXCEL_IMPORT_ID%></pre>	import
<%EXPECTED_COLUMNS%>	List of expected columns for Excel import

The following variables are predefined and can be used immediately:

	This variable is helpful for display error during import e.g.
<%LINE%>	"Import error in line X:"
<%UPLOADED_FILE_NAME%>	Name of the uploaded file (file upload/download widget)
	Display name of the uploaded file (file upload/download
<%DISPLAY_FILE_NAME%>	widget)
<%DELETED_FILE_NAME%>	Name of the deleted file (file upload/download widget)
	Ticket number of the current import process when importing data
<%IMPORT_TICKET_ID%>	using Email Import Business Case
	Subject of the users original email when importing data using Email
<%ORIG_EMAIL_SUBJECT%>	Import Business Case
<%RETURN_VALUE%>	In this variable the return code of the function/script is stored.
	The current widget name. Can be used for defining background
<%CURRENT_WIDGET_NAME%>	colours, default values or constant values for many similar widgets
	Variable has value 'true' if the current window is the window for
<%ACTIVE_COPY_WINDOW%>	copying rows
	Variable has value 'true' if the copy feature is applied. It is helpfull if
<%COPY_ROW_MODE%>	you want to define a special widget behaviour in copy case.

If the Business Case uses search fields, e.g. a filter lookup, then the matching variables are automatically defined for each search widget:

<%SEARCH_KEY_COLOR%>	Key-Value of the Lookup widget, mapped to column 'COLOR'
<%SEARCH_VALUE_COLOR%>	Value of the Lookup widgets, mapped to column 'COLOR'

7.7.6.3 Report variables

They are used to deliver content to a Business Case using the URL e.g. from a report, web portal or any place where hyperlinks can be used or simply to deliver the content of a widget from one Business Case to another one.

The content of a report variable can be defined in a report in a column of a query. Using a hyperlink in the report, the value can be transported to the connected Business Case . A report variable in an URL has the syntax FE_name.

Variable for Business Case

Variable name	riable name Report_Var_Name	
Variable description		
Variable value	Data output format	
Default value	999	
ок	CANCEL	

The default value is used only if the report does not provide a value for this variable.

Variable for Business Case

Variable name	Report_Var_Name		*
Variable description			
Variable value	Data output format		
Defines the type of the	variable, the data output for	mat and the expected data input format.	
Expected format for dat	te is MM.DD.YYYY (for example	ness Case start time then you must care at 2018: 12.31.2018) or YYYY-MM-DD (for example 2018-12-31T23:59:59.999-0700).	
-	vn date/time format just for this FORMAT=dd.MM.yyyy HH:mm (variable use additional parameter FE_nar (or using different format).	ne_FORMAT, where
	nal parameter dateFormat to d t=dd.MM.yyyy HH:mm:ss (or us	lefine your own date/time format. Paramete ing different format).	r dateFormat is glot
Output type		Text Number Date / Time	
Decimal places		2	
Show separate grou	ps		
ок	CANCEL		

In output format can set the data type.

Example of calling a Business Case with a URL:

http://localhost/apparo/pages/userInterface.jsf?bc=BCNAME**&FE_REPORT_VAR1=1234**&backLink=%2Fcon tent%2Ffolder%5B%40name%3D%27Apparo+Fast+Edit+Demonstration%27%5D

In the URL has the report variable **REPORT_VAR1** the value **1234**

This report variable can now be used in the Business Case or further processed.

7.7.6.4 SQL Variables

There are 2 different types of SQL variables:

• SQL variable (for all tables)

SQL variable for executing commands in all tables. Each time you use the variable the associated SQL is executed. This variable contains the content of the first row, first column (depending on the SQL command)

• SQL variable (for target table only)

SQL variable for the Business Case target table. All filters of the Business Case are considered.

Example:

Variable for B	usiness Case		
Variable name Variable description	<%NextID%>		
Variable value	Data output format		
SQL expressi	on		
select NVL(MA)	((ID),0) + 1 from FESAMPLES.SAMPLE_FORECAST		⊻ ?
		• s	YNTAX CHECK
+ - * 1	& ^ = > < >= <= ()		
Calculate the v	ariable value before each usage again		
ок	CANCEL		

The main difference is that a SQL-variable (for target table only) automatic uses:

- The filter of the Business Case
- All security-dependent filters
- All Widget dependent filters

Therefore, the SQL of the variable must also use the target table so that the filter will also find the same column names.

SQL variables (for target table only) are very useful for calculations that relate to the target table - e.g. sum of all sales, as all the used filters are considered automatically.

Since the output changes when using filter widgets, usually this dynamic filter restriction must also be considered.

In a **SQL variable (for target table only)** this is done automatically, in opposite to a SQL variable (for all tables).

An SQL variable is always executed when it is used. As result, the first result value is used.

7.7.6.5 Script variables

A script variable is a routine that returns a value. It is not connected to a database session.

Variable fo	r Business	Case
-------------	------------	------

/ariable name	<%city%>	*
ariable descriptior	1	
Variable value	Data output format	
Script body		
Script languag	je : javascript	
You can see a c	detailed JavaScript language description including examples by clic	king the question mark icon placed next to the editor.
Attention: If you for example:	want to use a Apparo variable in Javascript that contains text then yo	ou must use it in quotes,
	ce('<%TEXT1%>','<%TEXT2%>','text')	
If a script variab	le must return value true or false then it must be a string like 'true'.	
1 var grou	ups = afe.getGroupsByRegex('demo_office.*');	V 🔿
2 var resu	alt = groups[0];	
3 if(resul 4 result =	lt) { = result.substring(12);	
5 result = 6 }	<pre>= result.toUpperCase();</pre>	
7 result;		
8		
10		
11 12		
13		
14 15		
16		
17 18		
19		
20		
SYNTAX CHEC	к	
Calculate the	e variable value before each usage again	

The calculated value is returned by ,result'

You can use in the JavaScript routine SQL variables, reference variables and internal variables too. The Logic is defined by **JavaScript** and can be combined with SQL-Queries.

You can use scrip variables within database connection settings, but connection pooling will be disabled then.

Calculate the variable value before each usage again

If unchecked the variable will be calculated only once, when the BC starts

7.7.6.6 Extended JavaScript functions

Fast Edit offers the possibility to use advanced features besides from the standard syntax. The corresponding examples can be found in the designer when you click on the question mark icon.

Custom script example returning a string value based on security group:

```
var groups = afe.getGroupsByRegex('.*');
var result = 'Security groups of the current user: ';
var i;
var group;
for(i = 0; i < groups.length; i++) {
    group = groups[i];
    result = result + group + ', ';
}
// returning the calculated result from script
result;</pre>
```

Custom function example returning a string value:

```
// declaring a function
function myCustomFunction() {
  var result = 'defaultStringValue';
  // complext algorithm to evaluate the result of the method
  return result;
  }
  // calling the declared function to return a value from script
  myCustomFunction();
```

Example using custom functions declared in file

// If we have our custom functions declared in the text file we can use it in our script variable. // In our example we have a file 'C:\scripts\myFunctions.js' with content: 'function myFunctionPlus(a, b) {return a + b;}' // We can 'include' this content into the script variable as follow: <%FILE_CONTENT(C:\scripts\myFunctions.js)%>

// now we can use declared function
var x = myFunctionPlus(2, 1);

// variable 'x' now has value 3 x;

Example using Apparo variables:

// working with string variable, and adding a custom postifx
var result = '<%USER_NAME%>' + 'postfix';

// modifiying a result of sql variable returning a numeric variable
var result = <%SQL_COUNT_VAR%> / 100;

Example using Apparo LANGUAGE variable in a column name:

// In this example Apparo must read the content of the widget reference variable <%PRODUCT_EN%> or <%PRODUCT_DE%>. // PRODUCT_EN for a user with english language and

// PRODUCT_EN for a user with english language and // PRODUCT_DE for a user with german language:

var rc;

rc = '<%PRODUCT_<%LANGUAGE%>%>';

Example for calling a java class with return value:

// In this example Apparo creates an instance of 'MyCustomClass' class and executes the 'myCustomMethod' method var result = afe.callClassMethod('MyCustomClass', 'myCustomMethod'); result;

Example for calling a java class with arguments and return value:

// In this example Apparo creates an instance of 'MyCustomClass' class and executes the 'myCustomMethod' method var args = []; // create new array args[0] = "stringValue"; args[1] = 256; // passed to java as java.lang.Double args[2] = (new Date()).getTime(); // passed to java as java.lang.Double

var result = afe.callClassMethod('MyCustomClass', 'myCustomMethod', args);
result;

Example for dynamic variable resolving:

```
// In this example Apparo creates an instance of array and set current number of milliseconds (since
1.1.1970) for each element separately.
var args = []; // create new array
var i;
for(i = 0; i < 10; i++) {
    args[i] = afe.resolveVariable('TIME_MS');
}</pre>
```

Example for working with date widget variables:

```
// In this example we will compare current Date with widget Date
var my_date_widget = afe.resolveVariable('DATE_WIDGET');
var current_date = new Date();
```

//for explicit date usage, e.g. December 24, 2016 at 6:30pm use format: Date(year, month-1, day, hour, minute, second, millisecond) //var date = new Date(2016,11,24,18,30,0,0);

var text;

```
if (my_date_widget == null) {
  text = 'my date widget is empty';
  }
  else if (my_date_widget.getTime() > current_date.getTime()) {
  text = 'My date widget value is after current date';
  }
  else if (my_date_widget.getTime() < current_date.getTime()) {
  text = 'My date widget value is before current date';
  }
  else {
   text = 'The dates are equal';
  }
}</pre>
```

text;

Example for getting the name and content of the current widget:

```
// In this example Apparo is reading the name and content of the current widget.
// This is helpful for defining the background colour of many similar widgets or defining default
value/constant value without creating many different variables.
var current_widget= '<%CURRENT_WIDGET_NAME%>';
var current_widget_content = afe.resolveVariable(current_widget);
var red_colour_background = 'false';
```

```
if (current_widget_content > 100) {
  red_colour_background = 'true';
}
else if (current_widget_content < 50 && current_widget == 'MEASURE1') {
  red_colour_background = 'true';
}</pre>
```

red_colour_background;

Example for storing content into a file:

// In this example Apparo store text content into 'myFile.txt' file.
var fileContent = 'This is file content.';
var success = afe.createFile('c:\\files\\myFile.txt', fileContent);

Example for executing a SQL query:

// In this example Apparo executes SQL query to retrieve 'user_id' value of 'John Smith' in table 'MyTable'. var user_id = afe.executeSql("select id from MySchema.MyTable where sales_name='John Smith'");

Example for executing a SQL select:

```
// In this example Apparo executes SQL select to retrieve 'id', 'name' and 'price' values of all products in
table 'MyProduct'.
var productsArray = afe.executeSqlSelect('select id, name, price from MySchema.MyProduct');
var i;
var rowData;
var rowData;
var name;
var price;
for(i = 0; i < productsArray.length; i++) {
  rowData = productsArray[i];
  id = rowData[0];
  name = rowData[1];
  price = rowData[2];
}
```

Example for executing a SQL select and storing result into XML file:

// In this example Apparo executes SQL select to retrieve 'id', 'name' and 'price' values of all products in table 'MyProduct' creates xml String and stores it into XML file. var productsArray = afe.executeSqlSelect('select id, name, price from MySchema.MyProduct'); var i; var rowData; var xmlString = '<?xml version="1.0" encoding="UTF-8"?>\n<products>'; var xmlRow; for(i=0; i < productsArray.length; i++) { rowData = productsArray[i]; xmlRow = '\n\t<product id="" + rowData[0] + "" name="" + rowData[1] + "" price="" + rowData[2] + "" />'; xmlString += xmlRow; }

```
xmlString += '\n</products>';
```

```
var success = afe.createFile('c:\\myXmls\\products.xml', xmlString);
success;
```

Example for executing a SQL query with parameters:

```
// In this example Apparo executes SQL query with parameters.
var params = []; // create new Array
params[0] = 'John Smith';
params[1] = 'Germany';
var user_id = afe.executeSql('select id from MySchema.MyTable where sales_name=? and country=?',
params);
```

Example for executing a command:

```
// In this example Apparo executes command.
var returnValue = afe.executeCommand("c:\\scripts\\myfile.bat","c:\\scripts");
```

Example for making a row read-only:

// In this example we want to make a data row read-only when the PROJECT_COMPLETITION_DATE widget has value of a date in the past (the project is finished).

// First we must create a variable <%ROW_READONLY_VAR%> which will be used here.

// The goal is to return the same date as the widget if it is older then today, otherwise we will return dummy date.

// Returning date must be represented as string with proper format.

// dummy date in format of MM.dd.yyyy
var result='01.01.1990';

// today's date
var current_date = new Date();

// We need to read string value of PROJECT_COMPLETITION_DATE widget. // If the widget is storing timestamp then it's string value has format 'yyyy-MM-dd HH:mm:ss.S' e.g. '2015-12-24 18:00:00.0' // If the widget is storing number then it can be e.g. '42' or '42.1' var end date string = '<%PROJECT COMPLETITION DATE%>';

// If the PROJECT_COMPLETITION_DATE is not specified then we don't want to make row read-only.
// If it has value then we must compare that date with today's date.
if (end_date_string.length > 0) {

// Here we are constructing the Date object from the string in order we can compare two dates.
var end_date = new Date();

```
// we must set correct Year, Month and Day from the end_date_string
end_date.setFullYear(end_date_string.substring(0,4));
// watch out here: months are calculated from 0 so we must decrease it's number
end_date.setMonth(end_date_string.substring(5,7)-1);
end_date.setDate(end_date_string.substring(8,10));
```

```
// now we can compare the dates
if (end_date < current_date) {</pre>
```

```
// again, we must use correct format: MM.dd.yyyy
var end_date_string_EN_format = ";
end_date_string_EN_format += end_date_string.substring(5,7);
end_date_string_EN_format += end_date_string.substring(8,10);
end_date_string_EN_format += '.';
end_date_string_EN_format += end_date_string.substring(0,4);
```

```
result = end_date_string_EN_format;
}
```

```
// return the result
result;
```

Example for executing a SQL insert:

// In this example Apparo executes SQL insert and returns true if inserting is done successfully, otherwise returns false;

var x = afe.executeSqlInsert("insert into PRODUCTS(ID,DESCRIPTION) values (1, 'shirt')");
// variable 'x' is resolved as true if insert was done ok.

Example for reading Cognos session parameters

//In this example Apparo reads Cognos session parameter named 'userClassID'.

//Declaration of the result variable.
var result = ";

//Call Apparo function that reads all the Cognos session parameters and return them as 2-dimensional String array.

var sessionParameters = afe.getSessionParameters();

var i = 0;

//Iterating over all returned parameters
for(i; i < sessionParameters.length; i++) {</pre>

//If parameter's name (second dimension with index 0) is 'userClassID' then we assign parameter's value (second dimension with index 1) into 'result' variable.

```
if(sessionParameters[i][0] == 'userClassID') {
  result = sessionParameters[i][1];
  }
}
```

//Return the result result;

Example for exporting all Business Case data to file:

// In this example Apparo exports all Business Case data to file on filesystem and returns whether operation was successful.

// Note: Backslash symbols must be escaped, i.e. '\\' must be used.

```
var result = afe.exportAllRows('C:\\Users\\Administrator\\Documents\\allDataExport-
<%DATE_TIMESTAMP_SHORT%>.xlsx');
result;
```

Example for exporting selected Business Case data to file:

// In this example Apparo exports selected Business Case data to file on filesystem and returns whether operation was successful.

// Note: Backslash symbols must be escaped, i.e. '\\' must be used.

```
var result = afe.exportSelectedRows('C:\\Users\\Administrator\\Documents\\selectedDataExport-
<%DATE_TIMESTAMP_SHORT%>.xlsx');
result;
```

Example for running Email Business Case:

// In this example Apparo sends an e-mail for each modified row of the Table Business Case.

// First we must create an Email Business Case (e.g. 'NotificationEmailBc') that will be used for email sending.

// We can use variables of the Table Business Case in the Email Business Case definition.

// Next we must create a script file (e.g. 'sendingEmailNotification.js') containing single line: afe.runEmailBc('NotificationEmailBc');

// Then we must enable 'Enable Post row update execution' feature in the Table Business Case, set
"Automatic execution of" to "Script on server"

// and choose the 'sendingEmailNotification.js' in the drop-down list 'Name'.

// With such Business Case setup an email will be send every time a row will be updated, // including Excel import (manually or using automatic server-side import or Business Case Email Import)

7.7.6.7 Widget reference variables

It is possible to use the **current** content of a widget in within the filter of another widget. Other use cases are the usage within SQL and script variables or within labels.

Widget settings of database column PRODUCT_ID

Widget type	Mapping & Other	Features	Lookup & Dropdown & Multiselect	Visual	Help texts	Data output format
Column name	G	PRODUCT_ID		•		

The name of a widget reference variable is defined by the name of the column. Here: <%PRODUCT_ID%>

Example:

It's possible to filter the values of a lookup widget depending on the value of another widget.

A Business Case has 2 widgets:

#1 Widget **PLANT** with the current plant value

#2 Lookup-Widget **DEPARTMENT** that shows all departments of the current selected plant.

Therefore the filter of the widget DEPARTMENT must be used as:

PLANT_DEP = <%PLANT%>

The column PLANT_DEP must be part of the lookup database table of widget DEPARTMENT.

7.7.6.8 Environment variables

All system variables starting with ,AFE_' can be used within Business Cases and database connections.

You have to restart Apparo Fast Edit after defining the system variables.

Example for a Windows system variable:

ystem Properties		? ×	Environment Var	iables	? ×
General Advanced	Computer Name Automatic Updates	Hardware Bernote	<u>U</u> ser variables fo	or Administrator	
		1 110111010	Variable	Value	-
You must be logged (on as an Administrator to make mos	st of these changes.	TEMP	%USERPROFILE%\Local Settings\Temp	- 1
		-	TMP	%USERPROFILE%\Local Settings\Temp	
Performance					
Visual effects, proce	essor scheduling, memory usage, a	nd virtual memory			
		Settings			
				<u>N</u> ew <u>E</u> dit <u>D</u> elete	
User Profiles					
Desktop settings rel	stad to your logon		⊂System variable	s	_
Desktop settings fer	aled to your logon				-
		1	Variable	Value	4
		S <u>e</u> ttings	AFE_HOST	AQ4 TESTING	
			AFE_TEST AFE_TEST1	blade1	
⊂ Startup and Recove	ary		ClusterLog	C:\WINDOWS\Cluster\cluster.log	
Sustem startup, sust	em failure, and debugging informat	ion	ComSpec	C:\WINDOWS\system32\cmd.exe	-1
System startup, syst	en raidre, and debugging monitat	ion	1		- .
		Settings	New System Vari	able ? 🗙	
	Environment Variables	Error Reporting	Variable <u>n</u> ame:	AFE_DATABASE_HOST	
		-Iter Hobertung		F	
			Variable <u>v</u> alue:	localhost	
	OK Ca	ncel <u>A</u> pply		OK Cancel	

In Windows are environment variables named 'System variables'

Variables that are containing ___ (two underlines) in the name can be used too, but are not displayed in Apparo Designer in the variables list.

7.7.7 Inserting of new data rows

If enabled then insertion of new data rows is possible. In this case an empty data record will be shown below or above the existing data in the edit area.

It's possible to hide or place read-only widgets in the inserting area too. Optional it's possible to enable the insertion feature for certain user groups only.

Inserting of new data rows	es
If enabled then insertion of new data rows is possible. In this case an empty data record will be shown under the existing data in the inserting area. It's possible to hide or place read-only widgets in the inserting area too. Optional it's possible to enable the insertion feature for some user groups only.	
Insertion of rows is enabled for all users	
Inserting area is placed after editing area	
Inserting area is able to updale an already existing data row Sometimes the user is inserting a new row in the inserting area but the row is already here. If enabled then it is overwriting the existing data row without complaining. If disabled then the user is seeing an error message.	

Insertion of rows is enabled for

This provides three options, default is ,all users'

Inserting area is placed

Controls the placement of the insert area

after editing area	-
before editing area	
after editing area	

Inserting area is able to update an already existing data row

Sometimes the user is inserting a new row in the inserting area but there is already a row with the same primary key.

If enabled then it is overwriting the existing data row.

If disabeld then the user is seeing an error message.

Show labels of the widgets for insert area widgets too

In addition to the column headers in the edit area, also shows them above the input area.

Year	Month	Office	Product line	Product	My status		Plan data	Plan2	Plan3	Plan4	Plan5	Plan6	Plan7	Plan8
]			*	- open	٠		0	0	0				

7.7.8 Editing of data rows

If editing is activated, it also activates this dialog here.

Editing of data rows
If editing is disabled then all editing widgets will be displayed as readonly.
Editing of data rows is enabled for all users
Making whole data row in editing area readonly if
If the selected widget value will match entered value, the entire record (row) will be read-only.
No widget selected
ADD

You can allow editing of data for all users, for certain user groups only or based on a variable check:

Editing of data rows is enabled for	all users 🗸
	all users
	selected security groups
	if variable returns true

Making whole data row in editing area readonly if ...

If the selected widget value will match entered value, the entire record (row) will be read-only. This feature is helpful if you work with different record states like 'open', 'closed' and just certain records must be updateable.

Use English format to define numeric or date values.

The Excel import with copy & paste is recognizing the read-only rows too if the Excel import is using the edit area settings.

By clicking the ADD button you can select widgets that sets the row to be read-only based on a widget value

Editing widget	Widget title	 has value 	XXX	v	for	all users	-	×
ADD								

The value can also be a fix value or calculated by a variable.

Example for a calculated read-only column:

You create a hidden column named e.g. check_column, with always contains the value 'true'. This can be done by using e.g. the string 'true' as constant value in insert & update case.

Now you can create a script variable to check different conditions and return the value 'true' if the conditions are met and the row shall be read-only. Otherwise, the variable returns 'false' and users can edit this row.

Making whole	e data row in editing area rea	donly if						
If the selected widg	et value will match entered value, the enti	re record (row) will b	e read-only.					
Editing widget	Widget name	 has value 	<%check_true%>	V	for	all users	- >	۲
ADD								
			[400]					

[103]

7.7.9 Deleting of data rows

If deleting is activated, it is adding a delete button and selecting checkboxes. You can also activate the output of a security dialog here.

elete data rows m	anually								ń.
eleting of data rows is	enabled for	all users							
Enable dialog wind	ow for deleting	of selected data	rows						
Delete dialog sett	ings								
Delete dialog text	Language	Text							
	German	Alle markier	ten Zeilen entf	ernen?			V		
	English	Do you wan	t to delete the	selected <%SELECTED	ROWS_COUNT%	> data rows?	V		
Button titles	Language	"Yes button" labe	4		"No button" la	pel			
	German	Ja			Nein				
	English	Yes			No				
Delete Dialog Style	Font face	Size	Style	Align	Colour				
	Arial	- 14	Bold	- Center	# 000000				
Background colour	#FFFFFF								
Dialog window size	Width	Heig							
	350	* 150		*					

You can also change the text of the delete query and the label of the button. Furthermore, it is possible to adapt the layout of the delete query.

Variables are allowed.

Example

Do you really want to delete <%SELECTED_ROWS_COUNT%> rows?

If Delete all data rows on BC start is activated, the following dialog can be activated:

 Enable dialog window 	for deleting of a	all data rows		
Confirmation dialog	g settings for	'Delete All' button		
Delete dialog settings	Language	Text		
	German	Alle Daten löschen?		V
	English	Do you want to delete all data rows?		V
Button titles	Language	"Yes button" label	"No button" label	
	German	Ja	Nein	
	English	Yes	No	
Delete Dialog Style	Font face	Size Style Align	Colour	
	Arial	✓ 12 Normal ✓ Left	#000000	
Background colour	#FFFFFF	m		
Dialog window size	Width	Height		
	350	* 150 *		

7.7.10 Bulk data update

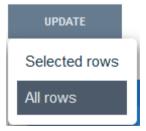

With the bulk update feature the user can update many rows with one mouse click. You can define bulk update widgets and with these widgets the user can set values for all selected rows. Hidden widgets can be updated/hidden bulk widgets with a constant value are allowed too.

Open	-			
Closed				
Open				
Ready for approval	Product	Accept yn	My status	
Rejected	T-Shirt Vienna		Open	-
 T-Shirts 	T-Shirt Moscow		Open	· · · ·
T-Shirts	T-Shirt 69's		Open	-

In Designer, you can activate a message window after a successful bulk update.

Bulk data update																																																																																								l	ė	6	Fe	ea	tu	re	s	J

	300		* 150		*																																																																																											

You can choose the update option between Selected rows only or All rows, or leave it up to the user to decide:

The message window is displayed only if you define a text for the output message.

Variables are allowed.

Sample output message

<%BULK_UPDATED_ROWS%> records were updated.

7.7.11 Excel Import

Excel is still one of the most powerful data processing programs: An ideal way to edit and present data in a simple way.

Unfortunately, Excel has disadvantages, the data is locked in a file.

Apparo Fast Edit offers several ways for the Excel import. Thus, the data can be tested auditable for errors and transferred in appropriate media (databases).

Excel import options

- With copy & paste directly from an open Excel file (Manual Import)
- By file import via the browser (File Import)
- Through automatic import from defined directories (Auto Import)
- By importing e-mail attachments (E-Mail Import)

The automatic import and import via e-mail attachment always requires a table Business Case, in which the settings for the (manual) import are defined.

7.7.11.1 General Excel Import

Run Close Save Cancel	eneral Excel import Import strategy Manual import using copy & paste	e Excel file import Automatic Excel file import

xcel export		
ata row validation		
Auditing of data changes		

Options

User can use Excel import using copy copy & paste feature only

If this option is activated, the business case only has the Excel import function with copy and paste. This means that immediately after starting the business case, the user only sees the Excel line import area, so this business case can only be used for Excel line import.

If this business case uses the same primary keys as defined in the database table, it is helpful to disable the "Check primary key constraints before saving" feature to improve import performance.

User can use Excel file import feature only

If this option is activated, the business case only has the import function for Excel files. The user can select an Excel file and import the data.

This means that immediately after starting the business case, the user only sees the Excel file import page. This business case can therefore only be used for the Excel file import.

Enable dialog window with result message after Excel data row import

After an Excel import the user can see a small finishing message. You can alter the text of this message here.

Special Import variables

IMPORTED_ROWS	Count of processed rows
INSERTED_ROWS	Count of inserted rows
UPDATED_ROWS	Count of updated rows

7.7.11.2 Import strategy

Insert new data row always always Update existing data row always Excel import strategy Import valid rows and ignore invalid rows Excel import strategy Autocommit after 1000 rows Write into a hidden widget too (for Copy & Paste) Check exact count of decimal places for numeric widgets For file import. User can edit the wrong data rows manually directly in web browser if the whole import file has < 100 wrong data rows	General Excel import	Import strategy	Manual import using copy & paste	Excel file import	Automatic Excel file import
Update existing data row always always Excel import strategy Import valid rows and ignore invalid rows a Autocommit after 1000 rows Write into a readonly widget too (for Copy & Paste) Write into a hidden widget too (for Copy & Paste) Check exact count of decimal places for numeric widgets	Insert new data row	always			
Excel import strategy Import valid rows and ignore invalid rows Autocommit after 1000 Write into a readonly widget too (for Copy & Paste) Write into a hidden widget too (for Copy & Paste) Check exact count of decimal places for numeric widgets					
Autocommit after 1000 rows Write into a readonly widget too (for Copy & Paste) Write into a hidden widget too (for Copy & Paste) Check exact count of decimal places for numeric widgets	opaulo onoting data for		_		
Write into a readonly widget too (for Copy & Paste) Write into a hidden widget too (for Copy & Paste) Check exact count of decimal places for numeric widgets	Excel import strategy	Import valid rows ar	nd ignore invalid rows	I	
Write into a hidden widget too (for Copy & Paste) Check exact count of decimal places for numeric widgets	Autocommit after	1000 rows			
Check exact count of decimal places for numeric widgets	Write into a readonly widge	et too (for Copy & Pas	te)		

Insert new data row

If enabled then new data rows (the primary key values of this new data row are not found in the target table) are inserted

There are two options, either a new row is always inserted or only with the prior examination (via JavaScript variable)

always	•
always	
only if script variable returns true	

Update existing data row

If this is enabled, existing rows will be overwritten (if the primary key combination is used twice), either always or by variable checking.

always	•
always	
only if script variable returns true	

Excel import strategy

With this feature you can configure the behavior of an Excel import.

Import valid rows and ignore invalid rows	-
Import valid rows and ignore invalid rows	
Rollback import if there are invalid rows	

You can select between a complete rollback if there is invalid content (no data will be imported) or whether only valid content will be imported.

Autocommit after 1000 rows

Apparo Fast Edit will commit the database transaction after defined number of rows has been processed in Excel import.

If value is 0 or no value is defined then this feature is disabled.

If the above setting is set to "rollback import if there are invalid rows" than this feature is disabled.

Write into a readonly widget too

If enabled then Excel import is overwriting the value of an read-only widget too

Write into a hidden widget too

If enabled then Excel import is expecting a value for a hidden widget too

Check exact count of decimal places for numeric widgets

When enabled then numeric values to be imported must exactly match the specified count of decimal places defined in the widget's data output format setting (must be set to "number").

7.7.11.3 Manual Import using copy & paste

This function allows direct import of data rows from Excel by means of copy and paste into this business case. The user can select many Excel rows (even more than 100,000 rows are possible), press the Excel import button and paste them into the text area. Of course, the order of the Excel columns must be the same as in the Business Case. Read-only and hidden widgets are not used for mapping, but only if they have a constant value. It is not allowed to import Excel cell values that span multiple rows, use file import in this case.

General Excel import	rt Import	t strategy	Manual impo	rt using copy & pas	te Excel file import	Automatic Ex	cel file
Column list description	Language	Column list de	scription				
	German		ier die kopierten ED_COLUMNS%	werte: V			
	English		opied Excel rows ED_COLUMNS%	V			
Style	Font face	Size	Style	Align	Colour		
	Arial	• 12	Normal	- Left	#000000		
Mapping from Excel	like widgets	from inserting a	area				
	-	from inserting					
	like widgets	from editing a	rea			·	
				ettings of insert area ettings of editing area			
	using an in		ig a use magers	cange of calling area			

Column list description

You can define a description text that is helpful for the user to know all expected Excel columns. All variables are useable and HTML tags are possible too.

You can use the internal variable <%EXPECTED_COLUMNS> that has a list of all expected columns using the widget labels.

All hidden or read-only widgets are expecting no Excel column value but the default/constant values of the hidden/read-only widgets are used automatically

Mapping from Excel

If you want to important into different widgets than of the editing/inserting area then you can define an individual mapping for Excel file import too.

7.7.11.4 Excel file import

This feature enables a manual import of an Excel data file into Apparo Fast Edit. The user can select an Excel file and the Business Case is importing the complete file.

Important: You must define a mapping of Excel columns like A, B, C and the associated widget. Just define the Excel column name in the right widget. You can define the count of header rows that must be ignored in tab "Excel file import".

General Excel import	Import strategy	Manual import using copy & paste	Excel file import	Automatic Exc	cel file import	
Header row count	2					
Error file format	Same as input file	•				
Excel file name	You can define a regula	en file names are not checked.	For example it must start with "c	ontrolling" etc.		
	Language	Excel file name				
	German			V		
	English			V		
Excel sheet name	Language	Excel sheet name				
	German	#1		V		
	English	#1		V		
Data file import description	Language Data f	le import description				
	German	die Excel-Datei für den Import auswählen:				V
	Plea	se select Excel text file to import:				V
Mapping strategy	Using Excel column	names like A,B,C				
Mapping Excel to widgets	Using Excel column	n names like A,B,C ecessary	Excel columns to widgets.			
	Using Excel column		e and the constant value de t area only.	penaing on the wid	uget settings.	
	Widget type	Database column Excel colu	imn name (like B or BA)	Default value	Constant value	

Options

Header row count

This number of rows are ignored during the imort

Error file format

Format of a file containing errors and their descriptions, a user can download after an import that finished with errors.

Excel file name

You can specify that the name of the Excel file must comply with a naming convention, e.g. it must begin with "Controlling", etc. You can define a regular expression for this. If the setting is empty, the file names are not checked.

Excel sheet name

An Excel document can contain many Excel worksheets. If this setting is empty, the first (from left to right) worksheet is imported.

You can enter a worksheet name for each language and you can use * and ? Example: Turnover* If there are many worksheets that match this name, the user must select the correct worksheet. You can also use item numbers, e.g. #2 for the 2nd sheet or #1 for the first. You can also use variables.

Mapping Excel to widgets

For the import a mapping necessary. This mapping is defining all Excel columns that must imported using this Business Case .

If you input for example Excel column F for the 1. widget then all values of Excel column F will be imported into 1. widget.

If the Excel document has no value in a cell and the mapped widget has a default value defined then Apparo Fast Edit is using automatically the default value.

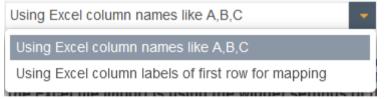

If a widget has a constant value then this value will be used for import depending on the setting (use constant value in insert case only or in insert/update case).

Data file import description

Contains the text of the select file dialog

Mapping strategy

Lets you choose between Excel columns or header title for the mapping.

Mapping Excel to widgets

Widget type	Database column	Excel column name (like B or BA)	Default value	Constant value
Input field	OFFICE_ID		1	
Lookup dropdown (for all tables)	PRODUCT_LINE_ID	а		
Lookup dropdown (for all tables)	PRODUCT_ID	b		

To import data from an Excel file, it is necessary to assign all the required Excel columns to the widgets. If a widget has no Excel assignment, it does not use the default value and the constant value depending on the widget settings.

The Excel file import only uses the widget settings of the insertion area.

The import requires a mapping between the Excel column and the widget. The mapping defines the Excel columns to be imported.

For example, if you enter an 'F' in the first widget, the Excel column F will be imported into the first widget. Default values are only used if they are assigned to an Excel column and only when inserting a new data row.

Constant values are always used, regardless of the mapping to the Excel column. The setting for use, either only when inserting a new row or when inserting and updating, can be found in the widget settings.

Settings for a CSV file for importing

When importing CSV files additional settings are required.

•	Settings for a CSV file for impo	rting	
	Character set of import file	ISO-8859-1	•
	Field separator	- 2	
	Use language defined separator		
	Quote mark	п	

Character set of import file

Contains a list of the available character sets.

Field separator

Definition of the field separator. Using the next setting it is possible to use an own separator for each used language.

Hint: If you need tab character as separator use "\t"

Use language defined separator

When checked then Apparo Fast Edit detects language type from file (for example from filename_en.xlsx as "en") and uses separator defined for detected language from language messages.

Quote mark

Definition of the quote mark - character used to enclose fields containing a separator, usually "

7.7.11.5 Automatic Excel file import

It is possible to automatically import files that the server can access (e.g. Excel files). In this case, Apparo Fast Edit checks whether files according to a certain file mask exist in a file directory of your choice.

If so, these files are imported into the working directory. After the import, these files are stored in the history files directory.

The settings "Field separator" and "Header number" are also used for manual file import. The time interval for looking into the feed directory can be defined in the settings of the current client.

Automatic file import means that the business case does not have to be started manually. After activating the function, the import takes place within the entered time interval.

If the feed directory is located on a second server, the Windows user who starts Apparo Fast Edit must have the rights to access the directory on this second server.

If there are many files ready for import, the file with the oldest change timestamp will be imported first.

All Excel file import settings are also used during automatic Excel file import.

General Excel import	Import strategy	Manual import using copy & paste	Excel file import	Automatic Excel file import
All Excel file import settings	are also used during au	tomatic Excel file import		
Our and the distance			v	
Source file directory			v	
File Mask	*.CSV			
Working file directory				
Error File Directory				
Error filename template	error_<%IMPORTED_F	ILE_NAME%>		
History file directory				
History filename template	<%IMPORTED_FILE_N	AME%>_<%TIME_MS%>		
Language	English			

Options

Source file directory

Defines the file directory in which Apparo Fast Edit looks for files to import. It is looking after each 'n' seconds into this directory.

The path can be: \\servername\folder1\folder2 or x:\folder1\folder2 or <%VARIABLENAME%>\folder or <%VARIABLENAME%>. The variable must deliver a correct path.

If empty then no automatic import will occur on this Business Case .

File Mask

The importable files must have the defined file mask. File mask can contain wildcards ? and *. Example: *.xls Caution: If the filename matches the file mask of multiple Business Cases, the used Business Case will be random. If empty, no automatic import will occur on this Business Case .

Working file directory

Optionally Apparo Fast Edit is moving the files to the 'Working file directory' first and then the import process is starting.

If empty, working file and directory will be the same as the feed file.

Error File Directory

File directory for error files with the error messages. If empty, no error results will be stored. Error filename template

Template file name for error files.

The usage of variables is possible, for example: <%IMPORTED_FILE_NAME%> name of the imported file (without path) <%TIME_MS%> numeric (UNIX) timestamp If empty, no error results will be stored.

History file directory

After import the files are moved into this file directory. If empty, no history will be stored.

History filename template

Template file name for history files. Mask can contain placeholders <%PlaceholderName%> where PlaceholderName is one of:

IMPORTED_FILE_NAME name of the imported file (without path) TIME_MS numeric (UNIX) timestamp

If empty, no history will be stored.

Language

Language definition (important for formatting such as formatting of date).

7.7.12 Verify that all the files were imported

In a multistage import file, where e.g. the 2nd import step depends on the full completion of the 1st file import, you can ensure by a script that the first import step is complete and that No more files need to be imported.

Strategy:

- 1. All files for step 1 are copied to the respective source directories
- 2. Via the script "autoImportChecker" you are waiting until all files have been imported from Step 1, i.e. the import of Step 1 is complete
- 3. All files for step 2 will be copied to the relevant source file directories

[APPARO_HOME]\FastEdit\import\autoImportChecker.bat or. [APPARO_HOME]/FastEdit/import/autoImportChecker.sh

Possible parameter:

-clientId <clientId> Example: -clientId QA When using this optional parameter, only the client "QA" is checked

-- afeURL <URL> Example: -afeURL http://localhost:18000/apparo When using this optional parameter, not the local installation is checked, but the one from the URL

Examples:

autoImportChecker.bat –clientId QA

This call checks all Business Cases from client QA whether it will import files at the moment or in the future. Here, the local Apparo application server is queried. The script is terminated only when no file imports are expected.

In the log file " autoImportcheckerResult.log" you will find the relevant log entries.

7.7.13 Excel export

With Excel row export the user can export data into an Excel file output and/or into the client clipboard. You can define an optional header, widget labels output, separation character and so on.

7.7.13.1 General

General Excel export using CS	format	
Exporting into Excel is enabled for all use	S 👻	
Export to Excel	all selected rows	
Mapping to Excel	1. widget = Excel column A, 2. widget = Excel column B,	
Exported file name	ApparoExport <%TIME MS%>	
Output the widget labels into first row		
Optional export header title	Language Optional header title of Excel export	
	German Datenexport aus Apparo Fast Edit	V

Options

Exporting into Excel is enabled for

The export can be disabled for all users or for selected security groups

Export to Excel

Defines which rows shall be exported

all selected rows

all selected rows

all visible rows of all pages

all visible rows of current page

Mapping to Excel

The mapping links Excel columns with the corresponding Database columns.

1. widget = Excel column A, 2. widget = Excel column B,	-
1. widget = Excel column A, 2. widget = Excel column B,	
use an individual mapping for Excel export	
use the same mapping as Excel file import	

There are two different mapping strategies:

The first visible widget is mapped to Excel column A, the second visible widget to Excel column B, and so on

Individual mapping - you can define for each widget the target Excel column in the widget settings. In this way not all widget values must be exported and the ordering is free definable.

Exported file name

Template for the name of the exported file. Variables can be used. The file extension (XLS, XLSX, CSV) is added automatically.

Output into an Excel file (client side)

Exports the data in an Excel file

Output the widget labels into own row

Shows an additional Excel row for the labels of the widgets

Optional Export header title

Is a headline defined, this will be displayed in the first Excel row. All variables can be used here.

Exporting to XSLX with locked Excel cells

If you want to export data for manual updates/inserts and you want to be sure that e.g. primary keys are not changed then this functionality can be very helpful for you. If enabled then export to XLSX is possible only.

Locking Excel columns	
Lock primary key columns in exported Excel file	Generated XLSX-Excel file is locking primary key columns and column header names. The user can not change these values.
Lock read-only widgets in Excel file	Generated XLSX-Excel file is locking read-only widgets and column header names. The user can not change these values.
Lock Excel sheet that no new Excel rows are possible	The idea is that in case that a user should update exported data rows and not able to add new data rows. That means that all other Excel cells are locked outside of the exported rows.
Lock Excel sheet that no new Excel columns are possible	The idea is that in case that a user should update exported data rows and perhaps adding new rows he isn't able to add additional Excel columns. That means that all other Excel cells are locked outside of the exported columns.

7.7.13.2 Excel export using CSV format

For the Excel export to a CSV file, further options are available.

General	Excel export using CSV format								
Character s	et of export file	ISO-8859-1							
Overwrite de	efault column separato	r 🖌							
		Language	Field separator						
		German	•						
		English	,						

Character set of export file

Contains a list of settable character sets.

Overwrite default column separator

Each installed language in Apparo Fast Edit has an own Excel column separator because Excel is using for some different languages different separators.

If the expected Excel column separator of your Excel version is not equal to the default separator of a language then you can here define the right Excel column separator, use \t for tabulator.

7.7.14 Copying of data rows

This can be used to copy rows within the target table.

In the same window:

Data within the same window can be copied

In the new window:

Marked rows will be is used in a new window including all primary keys. With this, the data and the primary keys can be altered before copying takes place. The primary keys are always shown.

Copy depending on a variable

Permission to copy data lines can be made dependent on a variable that returns true if the conditions are met.

Checking primary key Enable checking of PK before changing data in database. DB-columns that are used as primary keys must NOT be of	YES	

Enable checking of PK before changing data in database

If enabled then the Business Case ischecking the primary key for being unique. That is helpful if the primary key has no own unique index/primary key constraint in the database table.

It is possible to use database tables that have no primary key defined in the table. In this case this feature must be used to simulate a primary key.

Not activated:

A primary key can supply more than one hit, helpful, e.g. in denormalized tables.

Warning: The primary key is used to uniquely identify the data row to be stored. If the key exists multiple times, the value of more than one line can be changed or deleted.

7.7.16 Data row validator

Enables validation of input when inserting or updating data

You can:

- Access all widget content via widget reference variables
- Use SQL variables
- Define own error texts, which are output automatically

Data row validation

Technical:

You define a JavaScript routine that can access widget reference variable or SQL variable. An example can be obtained by clicking the question mark icon.

If the data row contains an error, an appropriate error message will be displayed automatically.

Hint: There is tutorial video 0410 Data Quality which handles this feature in the Training menu of the Apparo Designer

7.7.17 Data transaction handling

 Data transaction handling 	*
Data transaction handling Auto-commit: Store all data changes immediately into the database	YES

Auto-commit: Store all data changes immediately into the database

All data changes are committed immediately. The user can't roll back data changes, if the user leaves the Business Case and closing the window with right upper corner x-icon, then all data changes are stored too.

If this feature is enabled, then every change is stored ASAP (committed). The Excel data import is committed only once at the end in success case, because of performance reasons.

7.7.18 Automatic scripts and database procedures

It is possible to start a shell-script, database function/procedure or SQL-script before Business Case /server side file import starts, and/or after it is finished before forced Excel row import starts, and/or after it is finished after the user has inserted or updated data row

Automatic scripts and databas	e procedures			👬 Features
Pre Business Case executio	n (allows to run automatically a script or database func	tion/procedure if the user is star	rting the Business Case)	
Automatic execution of	Script on server (batch file, SQL file or Javascript file)	• for all users	~ ?	
Name		F		
Parameters for batch file only (separated with space)			V	
Return value variable	<%RETURN_VALUE%>		•	
	<%RETURN_VALUE%>		•	

With Pre/Post-Execution it is possible to run automatically a script or a database procedure/function at certain moments.

Other options are:

Script on server (batch file, SQL file or Javascript file)	-
Javascript commands	
SQL commands	
Database procedure	
Anonymous database block	
Script on server (batch file, SQL file or Javascript file)	

JavaScript commands

Allows you to enter JavaScript commands that will be executed when the event is triggered

SQL commands

Allows you to enter SQL commands that will be executed when the event is triggered

Database procedure

Allows you to run stored procedures or functions with parameters that will be executed when the event is triggered. Variables are allowed.

Return values can be stored within a variable and used within the Business Case, except for events after closing the Business Case.

Anonymous database block

Is similar to a stored procedure, but can be entered directly within the Business Case. You don't need database access.

Allows you to run an anonymous database block with parameters that will be executed when the event is triggered. Variables are allowed.

Script on server

Allows you to run a script (batch-, SQL- or JavaScript file) with parameters that will be executed when the event is triggered. Variables are allowed.

This behavior can be defined for all or for users that are members of a specified group. If the current user is member of a specified group then just the shell-script, database function/procedure, SQL-script or JavaScript file of this group is executed only.

all users	-
all users	
selected security groups	

In all other cases the default script/function/procedure is called only.

The commands are executed using the same database session like the Business Case and are separated by a semicolon.

Currently, Apparo Fast Edit is supporting Oracle, Microsoft SQL Server, IBM DB2, Sybase ASE/IQ (chained mode only) and Teradata databases.

7.7.18.1 Pre Business Case execution

Allows to run automatically a script or database function/procedure if the user is starting the Business Case

7.7.18.2 Post Business Case execution in success case

Allows to run automatically a script or database function/procedure after the user has closed tue Business Case with 'Ok' or 'Close' button

7.7.18.3 Post Business Case execution in failure case

Allows to run automatically a script or database function/procedure after the user has closed the Business Case with ,CANCEL' or ,X' button)

Fast Edit is checking the browser state by default every 180 seconds, it may take up to 3 minutes after closing the BC with ,X' before the script/procedure is executed.

7.7.18.4 Post insert execution

Allows to run automatically a script or database function/procedure after a new row was inserted

This insert can be done:

- From inserting area (Table Business Case)
- From insert mode (Single Business Case)
- From Excel file import
- From Excel row import using copy and paste
- From automatic server import
- From automatic import of email data-file attachments
- By copying row/s in the same window

The procedure or script will NOT be executed after modifying a row in edit area.

7.7.18.5 Post update execution

Allows to run automatically a script or database function/procedure after a row was updated

This update can be done:

- From inserting area (Table Business Case)
- From insert mode (Single Business Case)
- From Excel file import
- From Excel row import using copy and paste
- From automatic server import
- From automatic import of email data-file attachments
- By copying row/s in the same window
- After modifying a row in edit area

Optionally, a query window to activate that appears when the user updates a row of data from the input area.

7.7.18.6 Post Excel import execution

Allows to run automatically a script or database function/procedure after any kind of Excel import has finished

All Apparo Fast Edit variables can be used here, including:

- <%IMPORTED_ROWS%> count of imported rows
- <%INSERTED_ROWS%> count of inserted rows
- <%UPDATED_ROWS%> count of updated rows
- <%IMPORTED FILE NAME%> file name of the imported file (if applicable)
- <%EXCEL_IMPORT_ID%> An unique ID of type string for each Excel import

7.7.18.7 Post Widget cell value update

Allows to run automatically a script or database function/procedure if the user is changing a widget cell value (and leaving the widget)

Post widget cell value up	date executio	n (allows to run automatically a script or database function/procedure after a widget value was updated)
Maximum number of parallel ex	ecuting thread	5 5
Enable dialog window that	will be shown a	ter user has updated a widget value from editing area.
Dialog window setting	IS	
'Please wait' message text	All variables car	be used in this input field
	Language	'Please wait' message text
	German	Bitte warten
	English	Please wait
'Please wait' message font	Font face	Size Style Align Colour
	Arial	• 14 Normal • Left • #000000

After the user changes a widget value, a script / database procedure / anonymous database block is called for this change.

The call is made per widget value, i.e. if the user changes 10 values, the action is called 10 times.

The calls can be made in parallel if multiple threads are allowed. The maximum number of parallel threads can be set per Business Case.

Optional a message window can be activated.

The action will be defined on widget level:

Widget	settinas	of	database	column	OFF	ICE	ID

Widget type	Mappin	g & Other	Features	Actions	Visual	Help texts	Data output format
Call a script/procedure if the value of this widget was changed by user in a web browser Note: If the user is changing many values of this widget then it is possible to call the script/procedure in a parallel way for reducing waiting time.							
Automatic ex	ecution of [Database pro	cedure			-	
Name						V	
ок	CANCE	L					

7.7.18.8 Defining own client side Javascript

Allows the use of client side custom JavaScript functions ad the use of special Apparo JavaScript methods like afe.callClassMethod as mentioned earlier in this chapter.

Automatic scripts and database procedures	📩 Features
Defining own client side Javascript	
The complete Jouaccide will be part of the web browser output and will be accuded in the web browser only. You can use variables tool "transmitten graver number then you can use "WFHELC CONTEXTIVE the path-name yies" and store the script server side. You can showhide/calc widgets depending on user behaviour. See user guide for getting details.	
	V

Especially for this area you can use special methods to read and change widgets values A video guide using this methods to implement a planning feature is available in the Apparo Deigner in the training menu or online on <u>movies.apparo.solutions</u> and also described later in this user guide in the chapter "Planning application using a Table Business Case".

Special Apparo Methods

getAfeTableWidgetValue

Supported are

- getAfeTableWidgetNumValue reads and handles the values as numeric values
- getAfeTableWidgetStringValue reads and handles the values as string values

setAfeTableWidgetValue

Supported are

- setAfeTableWidgetNumValue writes the values as numeric values
- setAfeTableWidgetStringValue writes the values as string values

7.7.19 Auditing of data changes

The audit function you can use to document all data changes.

There are 2 different types of audit:

7.7.19.1 Simple Auditing

To save the audit information into the target table.

Auditing of data changes				
Simple auditing settings				
	Inserting a new row cas	se	Updating or deleting row	case
User name column	USER_ID	-	USER_ID	-
Date column	STAMP	-	STAMP	-
State (U,I,D) column				
Row edit type column				
In delete case delete data row physically				

It is possible to save the user name, date and time and the type of change for each row in the target table.

There are 2 different types of changes possible:

- The user adds a new row
- The user deletes or modifies a row.

The following states are possible: U = Update, I = Insert, D = Delete

Options

User name column Stores the name oft he user

Date column

Date column for storing update or insert date and time

State (U, I, D) column

The database column in that the state (U=Update, I=Insert, D=Delete) will be stored.

Row edit type column

In this auditing column the row edit type can be stored. The row edit type (type of string) is describing the way of editing.

In delete case delete data row physically

Physically delete row(s) with 'D' flag from table. If disabled then all deleted rows get the state 'D' and are not physically deleted.

7.7.19.2 Detailed Auditing

Storing detailed audit information in a separate audit database table helpful if every small change (eg a column) with name, timestamp, old&new values etc. should be documented.

Detailed auditing setting	IS		
Auditing database table	SAMPLES_ADV_AUDITING		
Auditing column for user name	USERNAME		+
Date column	CHANGE_DATE		-
State (U,I,D) column	STATE_TYPE		-
Row edit type column	ROW_EDIT_TYPE		
Custom value column	CUSTOM_VALUE		.*
	<%AFE_BC_FOLDER%>		V
Target table name column	TARGET_TABLE		-
Business Case identifier column	BCID		-
SQL statement column	SQL_COMMAND		-
Summary change column			
Widget mapping			
Editing widget	Auditing column for the old value		Auditing column for the new value
OFFICE_ID (NUMBER)	OLD_NUM_1	*	NEW_NUM_1
PRODUCT_LINE_ID (NUMBER	R) OLD_NUM_2		NEW_NUM_2
PRODUCT_ID (NUMBER)	OLD_NUM_3	-	NEW_NUM_3

Options

Database schema

The database schema in that the auditing table is already stored.

Auditing database table

The database table for the auditing data.

Auditing column for user name

The database column of the auditing table in that the user name who has changed data will be stored.

Date column

The auditing column for storing the date/time of the data change.

State (U, I, D) column

The auditing table column in that the state must be stored (U=update, I=insert, D=delete).

Row edit type column

In this auditing column the row edit type can be stored.

Custom value column

In this auditing column a custom value with variables can be stored that is stored in the auditing table only.

Target table name column

In this auditing column the name of the target table of this Business Case can be stored.

Business Case identifier column

In this auditing column the Business Case ID (short name) can be stored.

SQL statement column

In this auditing column the SQL statement can be stored. Be sure that this column can store a long text.

Summary change column

This text contains all data changes in one string like oldValue=1, newValue=2,...

7.7.20 Data History

Apparo Fast Edit can historicize a record (slowly changing dimension type 1 and 2). Information about "**Slowly changing dimension**", see:

http://en.wikipedia.org/wiki/Slowly Changing Dimensions

Note: For a historicizing the database must be able to perform "save points".

Since the Sybase / Teradata JDBC driver does not support this feature, the historicization of records within a Sybase or Teradata database is not possible.

This function automatically copies data rows when they are modified. It automatically manages the current record and makes it possible to either overwrite or historicize records within time frame definitions.

The user usually sees only the current line and not the data changes or deletions (if only virtually), the new rows are simply copies of the original lines.

Advanced	👘 Featu
Depending on the decision strategy (time res The row group normally contains all used prin For auto-handling the date from widget, it requ	s automatically copying a data row if the user is changing a value into it and it is managing the 'date from'date to' columns automatically. Iution) it is updating the row or copying including time frame update. In key wigdels. It was not nor chant and the form 8 date. I columns. Irse e.g. the ~%CURRENT_DATE%v variable set as constant value in insert case or as defaultivalue. I ast date with time (medium). For milliseconds use the custom output type e.g. 'dd.MM yyyrth.mm.ss.SSS'
lse columns as row group	OFFICE_0 • The history functionality is height if the user is updating data values or creating new data rows and the Business Case must create automatica a copy of this complete data row to be able to be able to see the history of the data changes. SALES STATUS_0 • Coperation of the data form of the base of the form of the base of the form of the larget table. With hese data counts it is possible to see the history of the data changes. • Coperation of the data form of the base of the form of the base of the form of the larget table. STATUS_0 • Coperation of the data form of the larget table. • Coperation of the larget table. PORECAST2 • Coperation of the data form of the larget table. • Coperation of the data form of the larget table. FORECAST2 • Coperation of the data form. • Coperation of the data form of the larget table. • Coperation of the data form of the larget table. FORECAST2 • Coperation of the data form. • Coperation of the data form. • Coperation of the larget table. FORECAST5 • Coperation of the data form. • Coperation of the data form. • Coperation of the larget table. FORECAST6 • Coperation of the data form. • Coperation of the larget table. • Coperation of the larget table. FORECAST6 • Coperation of the data form. • Coperation of the data form. • Coperation of the larget table. FORECAST6
Time resolution	Same second If there are 2 or more data changes into a row in the same time frame then Apparo will update the row only. If the next change is outside of the time frame then Apparo is copying automatically this row and changing the data from and data for columns automatically too Special case. If simple auditing is used with specified state (ULD) column then deleting a data row will insert a new data row with flag 'D' instead of setting the flag to the same data row. (= 'Slowy changing dimension' strategy)
Valid from' date column	VALID_FROM_TS Image: Control of the start of the s
Valid to' date column	VALID_TO_TS The Tast active' database column of the target table is used to mark the fast record of a row group. In most cases, this is the current entry, but it can also be an entry that lies in the future. This setting is optional. It is automatically managed by the Business Case.
Last active' flag column	CURRENT FLAG

The Business Case is managing automatically 'date from', 'date to' and "current" columns of the target table.

With these date columns it is possible to see the time dependencies of the changes.

Background

Apparo Fast Edit is combining data rows together to a 'row group'. A 'row group' are data rows that are storing detail information about an entity, for example a "product entity" has many different prices over the time.

Please don't use widgets (columns) for the history feature that contain read/write expressions.

Time resolution

If there are 2 or more data changes into a row in the same time frame then Apparo Fast Edit will update the row only. If the next change is outside of the time frame then Apparo Fast Edit is copying automatically this row and changing the 'date from' and 'date to' columns automatically too.

'Valid from' date column

The 'valid from' database column of the target table is used for storing the begin of the time frame for a row.

Validate that the new 'valid from' value precede the latest existing 'valid from' value of this row group.

Useful for manually entered valid from values HINT: this column must be a part of the primary key

'Valid to' date column

The 'valid to' database column of the target table is used for storing the end of the time frame for a row. This setting is optional. It is automatically managed by the Business Case .

Use for current flag

The 'current' database column of the target table is used for marking the current row of a group. This setting is optional. It is automatically managed by the Business Case .

Advanced settings

Main Advanced			
Date for infinity	12.31.2999 0:0:0 The infinity date is used in the 'di - d - day of month (1-31) - M - month of year (1-12) - yyyy - year - H - hour - m - minute - s - second e.g. 1.1.2999 1:45:45 or 12.31.21		t is MM.dd.yyyy H:m:s where
History flag for current row	1 Here you can define the value fo	r the current column for the data row with the current v ##.###" or for text you can use any character	alues
History flag for not current row		r the current column for all non-current data rows ##.###" or for text you can use any character	
Set historical entries to read-only	If enabled then data records with	a valid-to date that lie in the past cannot be deleted o	r changed.
Don't delete entries physically		a record with valid-to date in the future, d, but the valid-to date is set to the current date and wi	II be historicized.
Users can enter custom valid-to dates		om valid-to dates for the current row. ken from the feature settings (infinity date) and used fo	or the current row.
Use advanced constant value settings for 'valid-from' widget	If enabled, the use of constant ve	alues of the widget 'valid-from' can be defined in a mor	e detailed way.
Advanced constant value settings for	'valid-from' widget		
The constant value for inserting a new h	istory group entry	<%TIMESTAMP%> Use format 'yyyy-MM-dd HH:mm.ss.SSS' e.g. 2019-09-25 14:59:59.000	v
The constant value for editing an existing	g group entry	<%TIMESTAMP%> Use format 'yyyy-MM-dd HH:mm.ss.SSS' e.g. 2019-09-25 14:59:59.000	V
If activated, the user can manually overv	rite the set constant values		
If left empty, no constant values are used.	une if using coquity group dopo	adapt constant values	

It contains the settings for the infinity date, the current flag and other settings.

Date for infinity

The infinity date is used in the 'date to' column for the current data row. The date format is: MM.dd.yyyy H:m:s Where

- d day of month (1-31)
- M month of year (1-12)
- yyyy year
- H hour
- m minute
- s second

e.g. 1.1.2999 1:45:45 or 12.31.2999 11:11:11

History flag for current row

Here you can define the value for the current column for the data row with the current values Specify number in format "###,####" or for text you can use any character.

In most cases the value '1' is used here.

History flag for not current row

Here you can define the value for the current column for all non-current data rows Specify number in format "###,####" or for text you can use any character

In most cases the value '0' is used here.

Set historical entries to read-only

If enabled then data records with a valid-to date that lie in the past turns to read-only and cannot be deleted or changed.

Don't delete entries physically

If enabled and the user deletes a record with valid-to date in the future, the entry is not physically deleted. In this case the valid-to date is set to the current date instead and will be historicized.

Users can enter custom valid-to dates

If enabled, the user can set manually custom valid-to dates for the current row. By default is the valid-to date taken from the feature settings (infinity date) and used for the current row automatically.

Use advanced constant value settings for 'valid-from' widget

If enabled, the use of constant values of the widget 'valid-from' can be defined in a more detailed way. If this feature is activated, but the constant values for inserting and/or editing were left empty, then no constant values are used.

Set constant values are valid for all security groups if using security group-dependent constant values.

The advanced constant value settings for 'valid-from' widget offers three options:

1. The constant value for inserting a new history group entry

You can use custom or predefined variables here (e.g. <%TIMESTAMP%> or <%CURRENT_DATE%>) or a fix date value with the format 'yyyy-MM-dd HH:mm.ss.SSSSSS' e.g. 2019-09-25 14:59:59.123456

1. The constant value for editing an existing group entry

You can use custom or predefined variables here (e.g. <%TIMESTAMP%> or <%CURRENT_DATE%>) or a fix date value with the format 'yyyy-MM-dd HH:mm.ss.SSSSSS' e.g. 2019-09-25 14:59:59.123456

2. If activated, the user can manually overwrite the set constant values

Users can enter manually custom values instead of using the given constant values.

7.7.21 Security

This limits the general access to the Business Case (whitelist). Only users who are member of at least one of the entered groups can use this Business Case. Security groups are to be entered separated by commas.

Security		
	ed list of security group names. Only users, who are members of at least one of these groups, will be able to open this Business Case. % can be used in group names both representing any number of characters. Example: controlling* will accept groups like controllingAfrica	, controllingUSA, controllingEurope etc.
Security group	Security_Group_A,Security_Group_B, Security_Group_C,Security_Group_D	

Wildcards * and % can be used in group names both representing any number of characters. Example: controlling* will accept groups like controllingAfrica, controllingUSA, controllingEurope etc.

7.7.22 Limited Access

The limited access limits the possibilities of a Business Case to output data only.

In the limited access mode can:

- No data be entered or changed (neither manually, yet over the Excel Import)
- No scripts or database procedures (functions) get started
- Buttons only limited be used

Limited access (readonly mode)		
If this Business Case is limited then all widgets in	n edit area are read-only and:	
Save" button is hidden 'Inserting is disabled Inserting is disabled Excel row/column import button is disabled Manual data file imports disabled Locking is disabled Pre/post execution is disabled	ad	
Select limited access type:		
 Limited for all 	- The complete Business Case is read-only	
Limited for security groups	- Only members of the defined roles or groups can not change data	
C Limited if variable returns 'true' valu	 Limited if the result of a variable is 'true' 	

The limited access may be restricted

- for specific security groups
- when a variable returns true (for example, to avoid entering of data during maintenance periods)

7.7.23 My own database error messages

When the database an error returned is the original message shown by default. With this feature you can define own more understandeble messages for your users.

The field SQL status is optional, but may help to group error messages.

If you want to define your own messages, you must first import the DB type template file, stored in the 'dbmessages' path.

Example:

To define a custom message for Oracle Code ORA-02291 enter '02291' in the field "SQL Error Code".

My own	database error messages					🔥 Features
× Del	ete					
Custo	om SQL messages

	Database type	Language	SQL code SQL	state	Message text	Action
Oracle	e 🗸	German				ADD

8 Single Business Cases (SBC)

A single Business Case (SBC) is used to represent a single data set (database row). A typical application is a data entry screen or a detailed view.

The functions and settings of the SBC are substantially identical to those of Table Business Cases. This chapter focuses on the features and the settings that apply only to the single Business Case .

Apparo Fast Edit

8.3 Visual

Here you define the general optical settings for the single Business Case . These settings are different from those in Table Business Case

Target table Header Footer Visual	Colours	Widgets	Row ordering	Link into Portal			📩 Feature
Label width (px)	100	*					
Widget width (px)	200	*					
Visual column label widths	100,105,100						
Visual column widget widths	200,205,200						
Gap width between data rows(px)	2	*					
Hide application header							
Enable a general button bar for rich text widgets							
Enable dialog window with error message in case of error	~						
Window background image URL					V	r.	
Show just the first data row only							
No data to display message	Language		No data to display n	nessage			
	German		Keine Daten zum A	nzeigen	V		
	English		No data to display		V		

Options

Label width (px)

Width of the label in pixels

Widget width (px)

Width of the input area of the widget

*

Visual column label widths

Defines the visual column label widths. If no value is defined for visual column label width then 'Label Width' property is used as default value; e.g.

100,150,200	3 visual columns with label widths 100 (px), 150 (px) and 200 (px)
100,,200	3 visual columns with label widths 100 (px), 'Label Width' (px) and 200 (px)
,,200	3 visual columns with label widths 'Label Width' (px), 'Label Width' (px) and 200 (px)

IMPORTANT: Negative numbers are not valid.

Visual column widget widths

Defines the visual column widget widths. If no value is defined for visual column widget width then 'Widget Width' property is used as default value; e.g.

100,150,200 3 visual columns with widget widths 100 (px), 150 (px) and 200 (px)
100,,200 3 visual columns with widget widths 100 (px), 'Widget Width' (px) and 200 (px)
3 visual columns with widget widths 'Widget Width' (px), 'Widget Width' (px) and 200 (px)

IMPORTANT: Negative numbers are not valid

Gap width between data rows(px)

The optical gap between data rows in pixels, default is 2

Hide application header

Hides the blue application header

Enable a general button bar for rich text widgets

When this feature is enabled, the user sees only a button bar with buttons for bold, italic, underline, etc. for changing the text style in rich text widgets.

This button bar is necessary when using text area type widgets with rich text functionality (bold, italic, underline, use different colors). The general button bar is visible as in Microsoft Word. If it is disabled, each text area with rich text functionality has its own button bar.

Enable dialog window with error message in case of error

If this setting is enabled than a pop-up dialog window will be displayed after each error.

Window background image URL

It is possible to use own background picture using an URL.

Show just the first data row only

When enabled only first data row will be displayed; otherwise additional buttons "<<" and ">>" will be displayed to show previous respectively next data row.

No data to display message

Message presented to user when there are no data to display

8.4 Starting the Single Business Case in Insert mode using URL parameter

The URL parameter insertMode=true allows to start the SBC in insert mode.

Usage example:

https://demo.apparo.services/demo/pages/businessCases/userInterface/businessCase.xhtml?bc=BC_Areas &clientid=Demo+g2&insertMode=true

9 Business Case Sets (Set)

Sets group multiple Business Cases in a tab view. The Business Cases can be accessed with tabs and edited comfortable.

Main settings				
Identifier / Short name	Set			
Business Case name	Set			
Security group				
Select Business Cases	م ا			
	Available		Selected	
	\Demo page #11 small applications\SAMPL MASTER PROD - SMALL APP		\Demo page #11 small applications\SAMPL MASTER PROD LINES - ENTRY	
	\Demo page #11 small applications\SAMPL MASTER PROD PRICE		\Demo page #11 small applications\SAMPL MASTER PROD DETAILS - App	
		+	\Demo page #11 small applications\SAMPL MASTER PROD LIST - APP	+
		⇒	<i>V</i>	
		+		+
		10		
	Show just Business Cases of current folder only			
	Show folder path			
Notes				

9.1 Selection and positioning of Business Cases in the set (Set)

In ,Available' you find all existing Business Cases.

By double-clicking or using the arrow keys, these are assigned to the set.

The positioning within the set is also done via arrow keys or the mouse.

By holding down the Ctrl key you select multiple Business Cases and move it to the desired position.

9.2 Colors

In colors you can set the color of the tabs (tab):

Colours

Inactive tab background colour	#E7E7E7	•
Inactive tab text colour	#336699	
Active tab background colour	#336699	
Active tab text colour	#FFFFF	• *

9.3 Tab Widths

In Table width you define the width of the tabs

Tab widths

Business Case name	Tab width
SAMPLES - product lines	200
SAMPLES - product details	200
SAMPLES - product list	200

9.4 Global Set filters

A global filter is a connection between different filter widgets of different Business Cases of a Business Case Set. That is helpful if some Business Cases of this Set must be filtered in the same way when if the user is jumping to another Business Case.

Example: All Business Cases must filter for the same product and the user is selecting the product just once. It is possible to use many different global filters parallel, e.g. for product and for product-line.

Global Set filters
+ Add X Delete
Global filters
Global filter Name
> global

All existing filter widgets of the Business Cases in the Set are listed here. To create a global Set filter, move all related filters to ,Selected filter widgets' and hit OK.

Global filter

Global filter name	global	*	
Select widgets	Available filter widgets		Selected filter widgets
	SAMPL MASTER PROD LIST - APP.product line	4 4 4 4	SAMPL MASTER PROD LINES - ENTRY.Product Line
ок	CANCEL		

10 E-Mail Import Business Case (EIBC)

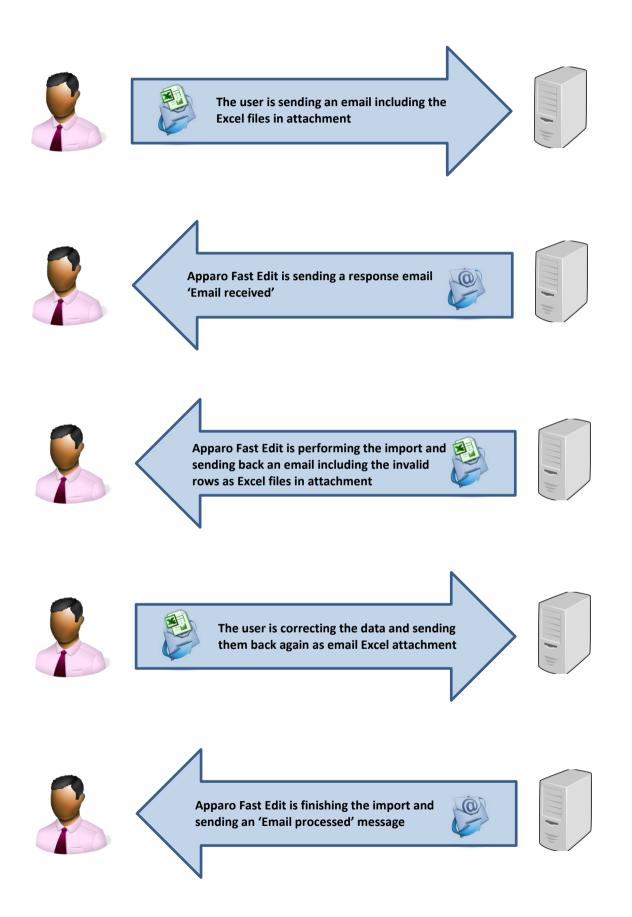

The Excel Email Import feature enables you to import data that is stored in Excel files (CSV, XLS, XLSX) from email attachments.

That means the user can send an email with **Excel files in attachment and the data of these Excel files will be imported automatically in your relational databases**.

The user is getting automatically answer-emails that are informing the user about the progress or data quality issues.

All activities can be logged in database table, the emails and attachments can be stored physically on the server.

10.1 Creating a new Business Case of type 'Email import'

When clicking on New Business Case in the Business Case list the following selection list will appear:

Please sel	ect type of Business	s Case you want to create now
	Table	A table Business Case is showing many data rows on the same page. The user can filter the data, edit, import from Excel, export to Excel and so on.
	Single	A single Business Case is showing just one data row only.
	Set	A grouping of multiple Business Cases (table/single) for more comfortable usage. You can define global filters that are filtering all Business Cases automatically too.
×	Email import	Importing Excel data directly by email - send Excel sheets using email attachments and Apparo will import the Excel data directly int the database including file uploads. No web browser is necessary, just an email.
\succ	Email	An eMail Business Case is a definition of an email text including usage behavior and can be used in another Business Cases of type 'table' or 'single' only. In these Business Cases it is possible to define buttons that can use this eMail Business Case.
>	Action	Purpose of Action Business Case is to execute scripts or database procedures that can be called from a report/HTML page. Usage of AJAX and Javascript for automatically executing in the background is possible too.

CANCEL

Click on Email Import to create a new 'Email Import Business Case'

For the setup we will need a pre-defined email connection and at least one database connection, used for the Business Case that will perform the import.

These Business Cases are also containing all definitions for securing the data quality.

The Business Cases must have activated the Excel file import feature.

10.1.1 New Business Case - Main Settings

The main settings require the following settings:

- Identifier: The short name of the Business Case (must be unique)
- Business Case Name: This name will appear as name when we link the Business Case to the portal
- Email connection: The email connection for sending and receiving emails
- Internal description: Optional. For documentation purposes only.

Email Import Business Case (EIBC) - Main settings

Identifier / Short name	Sales_figures	*
Business Case name	Email import sales	*
Email connection	Email2	*
Enabled	✓	
Notes	For importing the monthly sales via email	
NEXT	CANCEL	

Fill all necessary fields and click 'Next' to create the Business Case

10.2 Overview of all possible settings

Once the Business Case iscreated we will see the following overview. Here you can save and close the Business Case and click though the tabs of the settings:

- Introduction: Contains usage examples and explanations
- Main Settings: Contains the main settings and the server path for storing emails and attachments
- Importing Groups: Contains the import groups, the detailed settings how shall be imported
 eMails: Here you can define the text of a failure email, for the case that no import group is
- matching
 Logging: Contains the logging settings, details like user name can be mapped here to a database
- Logging: Contains the logging settings, details like user name can be mapped here to a database column
- Variables: Contains predefined variables and you can create own JavaScript variables

Close Save Cancel	Main Email file	system storage	
Introduction	Identifier / Chart name	Online formation	1.
Main Settings	Identifier / Short name Business Case name	Sales_hgures	
Import Groups	Email connection	Email2	•
eMails	Enabled	✓	_
Logging	Notes	For importing the monthly sales via email	
Variables			

10.3 Main Settings

This tab contains, beside from the main settings, the path for storing emails and attachments physically on the server.

Mair	Email file system sto	orage
Path	for storing the email content	<%AFE_HOME_DIR%>\emails
Email fi	e system storage	

10.4 Importing Groups

An import group contains the definitions of which attachments are expected and which business case should perform the import. It also contains the security settings, log settings and the reply email texts.

Import Groups					
+ Add new impo	rt group				
			-		
List of defined	import groups f	or this email import Business	Case		
List of defined Order number	import groups f	or this email import Business Import group name	Case Description	Enabled	Actions

Adding a new import group

10.5 Importing group settings

10.5.1 Main group settings

It contains the import group name (unique) and an optional description text. You can enable or disable the import group here.

Email import group settings

Import group name Description Enabled Error handling strategy Rollback import if there are invalid rows Error list file format XLSX Language	Main group settings	Business Cases	Email texts	Security	
Description Enabled Error handling strategy Error list file format XLSX Error list file format					
Enabled Error handling strategy Rollback import if there are invalid rows Error list file format XLSX Language Enable	Import group name	Group1			
Error handling strategy Rollback import if there are invalid rows	Description				
Error handling strategy Rollback import if there are invalid rows					
Error list file format XLSX	Enabled	✓			
	Error handling strategy	Rollback import if there are i	invalid rows		
Language English	Error list file format	XLSX 🗸			
	Language	English 🔹 \star			

Import group name

The unique name for this import group

Description

Optional: Short description of a use case. For example, "Import profile for collecting monthly sales data".

Enabled

The import group can be disabled here.

Error handling strategy

When there is a data error in an email attachment, there are two possible strategies to deal with it. Either the entire import process is aborted and no data is written, or the process skips rows with errors and saves the good ones. This value overrides the 'Excel import strategy' of the Table Business Cases.

Error list file format

If an import was completed successfully and some errors occurred, the user will receive the errors as an attachment file in the specified format. For CSV format, you must specify a separator. If you want to use a tab, please enter '\t'.

Language

For validation errors in email attachments, users receive validation messages in the selected language.

10.5.2 Business Cases

Contains the mapping to all Business Cases that are defined to perform the import. When an email from a valid sender arrives, Apparo Fast Edit automatically analyses the structure of the attachments and comparing the structure with the defined import groups.

Email import gr	oup settings						
Main group setting	s Business Cases	Email texts	Security				
ADD NEW BUSINESS	CASE						
import group.	mail, in order to be accepted			s) must be mapped to the defined table Busi	ness Case files. For example if the ema	il contains a text file attachment that stays unused, the	ernail will not be accepted by the
Order number		Business Case identi				Excel file attac	chments Actions
1	중 🛧 🔸 SAI	PL WF WORKFLOW	12			> *.excel	×
OK	CANCEL						

10.5.2.1 Add new attachment

You need to define at least one email attachment for every defined importing Business Case.

Email file attachment settings - Excel file							
Basic settings	Advanced Excel document data constraints						
Please note, that	only the first sheet of an excel file will be imported.						
File name pattern	*.excel	*					
Description							
Min. and max. occure	nces 1 - 1 *						
Language	English						

Creating a new file attachment

The following properties are expected:

- File name pattern: Defines the allowed file extension (*.excel allows all Excel files: .xls, .xlsx, .csv)
- Description: For the internal documentation
- Starting row: For the case it contains a header in row 1, we start the import in row 2
- Min and Max occurrences: The minimum should be at least 1 the user gets an error email if the attachment contains less attachments than expected
- Language: Important for language sensitive data types e.g. dates and numbers

10.5.2.2 Advanced Excel document data constraints

This feature is optional:

1

Here you can define the expected data column types, this feature allows Apparo Fast Edit to better distinguish similar Excel file attachments.

Email file attachment settings - E	xcel file	
Basic settings Advance	ced Excel document data constraints	
Starting row 1	*	
Expected row and column	n counts	
Number of data columns		
Minimum row count		
Maximum row count		
Expected data column typ	pes	
This functionality is not supported	d for CSV files.	
Column name (eg. A, B or AA)	A	
Column type	Text	
Short description		
	ADD COLUMN TYPE	
Column name Column tv		Actions
Column name (eg. A, B or AA)	ype Short description	Actions
No column definitions found		

Expected row and column counts

Here you can define the number of columns and the minimum/maximum number of rows for valid Excel imports.

Expected data column types

Here you can define all expected columns in detail

10.5.3 Email texts

Contain the bodies of different auto response emails. Optional. When empty, no email will be sent.

There different kinds of response emails:

- 'Matching email import group found': Sent when email received
- 'Confirmation email': Sent when confirmation by user is necessary
- 'Security constraints not met': Sender does have the required rights for the import
- **'Email processing cancelled because of error':** Sent in case of data errors and the import is set to 'Cancel the import in case of errors'
- 'Errors occurred, but import was performed': Sent when the import is finished with errors
- 'Email successfully imported'
- **'Limited access prevented email processing':** The feature 'limited access' is activated and prevents the import
- 'Error list': Email with file attachment containing all erroneous rows

Email import group settings

Matching email import group found Email subject [Data Import] <%ORIG_EMAIL_SUBJECT%> / Ticket <%IMPORT_TICKET_ID%> / Info - email received	V V
Email body This is an automatically generated email by Apparo. Ticket number: <%IMPORT_TICKET_ID%> Data structure of your email attachments is correct. They are going to be imported now. You will receive additional emails informing you about the import progress.	
Email subject [Data Import] <%ORIG_EMAIL_SUBJECT%> / Ticket <%IMPORT_TICKET_ID%> / Success - all files from your email have been imported by Apparo. Email body This is an automatically generated email by Apparo. Ticket number: <%IMPORT_TICKET_ID%> Your email attachments were imported completely successfully.	p V V
The import is finished now. Security constraints not met Email subject [Data Import] <%ORIG_EMAIL_SUBJECT%> / Ticket <%IMPORT_TICKET_ID%> / Error - access denied Email body This is an automatically generated email by Apparo. Ticket number: <%IMPORT_TICKET_ID%> Your email didn't meet security criteria. Maybe it didn't contain a required keyword or it was not sent from an expected email address.	V

Auto response email texts

10.5.4 Security

The email import can be secured:

- by limiting the allowed email senders (comma separated list of email addresses)
- by limiting the <u>email senders</u> based on a security group: the user account including email address must be stored in an MS Active Directory system
- by using <u>a text keyword</u> that must be delivered in the subject or body of the email
- by enabling <u>a confirmation email</u> (an automated email is returned to the sender, which has to be confirmed within a defined timeframe)
- by <u>a list of trusted email servers</u> (only emails of listed servers are accepted)

All emails can be encrypted using SSL

The general access can be restricted by using the limited access feature in the tab 'Security':

- No limitations: Default value, no restrictions
- Limited for all: Nobody can use this import group
- Limited for variable value: Not useable if a variable return 'true' e.g. a variable returns true during the time period when the database is performing maintenance tasks

Main group settings	Business Cases	Email texts	Security
Allowed email sender addres	ises		
Security keywords			
Email confirmation required			
Confirmation reply must com			15 minutes
Check if the email address o	f the sender is defined in th	e local security syst	tem 🗸
Authorized security groups			
Business Case limited acces	SS		No limitation (default)
			Limited for all
			Limited for variable value

Email import group settings

10.6 eMails

It contains the general error message for the case that no matching import group could be found to perform the import.

This can have different causes:

- Erroneous setup of import groups
- Erroneous attachments (e.g. file does not match the file import template)
- The import group can be temporary disabled by the administrator
- Disabled by a variable (e.g. a time controlled variable to avoid issues during a maintenance period)

Close Save Cancel eMails		
Introduction Main Settings Email subject Import Groups Email body eMails Logging Variables	Data import <pre>cmould_email_sobjectspy/ficket</pre>	V V
E-statist	Internal error occurred and processing stopped	v
Email subject	[Data Import] <%ORIG_EMAIL_SUBJECT%> / Ticket <%IMPORT_TICKET_ID%> / Error - Internal error occurred	

General error message

10.7 Logging

All events can be logged into an own database table.

In order to log all possible values the table will need the following columns:

- Column for client name: What client was used for the import
- Column for sender address: What sender address tried to import
- Column for event timestamp: Timestamp
- **Column for ticket ID:** Ticket ID, unique ID for the import event
- Column for storage path: Where is the email and attachment stored
- Column for Business Case ID: What Business Case performed the import
- Column for importing group name: What import group performed the import
- Column for the import message: Plain text with error message
- Column for the log severity: Can be warning, error, info or debug
- Column for the message code: A number representing the message

Close Save Cancel	Logging	
Introduction Main Settings	 Write a log to a database table Email import log settings 	
Import Groups eMails	Database Connection	SAMPLES
Logging	Logging table	EMAIL_IMPORT_LOG
Variables	Column for the log sequence number	LOG_SEQUENCE_NUMBER
	Column for client name	CLIENT_NAME
	Column for sender address	SENDER_ADDRESS
	Column for the event timestamp	EVENT_TIMESTAMP
	Column for the ticket ID	TICKET_ID
	Column for storage path	STORAGE_PATH
	Column for the Business Case ID	BUSINESS_CASE_ID
	Column for the import group name	IMPORT_GROUP_NAME
	Column for the import message	IMPORT_MESSAGE
	Column for the log severity	LOG_SEVERITY
	Column for the message code	MESSAGE_CODE

You can log all email import related events into a custom database table. The following definition can be used to create such a table:

10.8 Variables

You can use JavaScript to compute advanced calculations, and the result can be used in importing Business Cases as any other variable.

There is a list with pre-defined variables, ready to use.

Close Save Cancel	Variables		
Introduction	+ Add X Delete

11 E-mail Business Cases (EBC)

An e-mail Business Case is used to send e-mails. It contains the definitions, such as subject and body. Content, recipient, etc. can be made dynamic with variables.

An e-mail Business Case is called usually by button froms Single or Table Business Cases.

An e-mail Business Case can access all the widget reference variables of the current line. All other variables can also be used.

Comment via eMail and button-click

English	Add attachment	Send eMail	V	Cancel	V

12 Action Business Cases (ABC)

An Action BC can start actions with or without user interaction.

It can be executed with output window or silently without output window.

It is possible to pass any values to the Action BC, which can then be used as parameters for the actions. An Action BC can also contain own web outputs, even buttons like Yes/No are possible.

12.1 Possible Actions

An overview of the 4 options and their meaning, use case are following in Use Cases

Enable Pre Business Case action execution
 Enable Post Business Case action execution in success case
 Enable Post Business Case action execution in failure case
 Enable Exit Business Case action execution

Enable Pre Business Case action execution

The default case, an action is started when the Action BC starts

Enable Post Business Case action execution in success case

Another action can be started when the user clicks on the green OK button in the closing dialog

Enable Post Business Case action execution in failure case

Another action can be started when the user clicks on the red Cancel button in the closing dialog

Enable Exit Business Case action execution

Another action can be started when the user clicks on the green OK or red Cancel button in the closing dialog

The first action usually starts a script or calculation or writes something to the database, while the second action usually triggers e.g. an email notification.

12.2 Use Cases

Action BCs can be run without user interaction, started when a JavaScript event triggers by calling the Action BC URL

Or

Action BCs can be run with user interaction, started by a JavaScript event when the user e.g. clicks a checkbox, or simply when clicking an URL button or a hyperlink.

Basically, there are two operation modes:

- Without output window, the silent mode, the user does not know that an Action BC has been started.
- With output window, issues a notification showing the process output, e.g. a calculation

12.3 Creating a new Action Business Case

Select Action to start a new Action BC

🔁 Apparo			
	Please sele	ect type of Business	Case you want to create now
		Table	A table Business Case is showing many data rows on the same page. The user can filter the data, edit, import from Excel, export to Excel and so on.
		Single	A single Business Case is showing just one data row only.
		Set	A grouping of multiple Business Cases (table/single) for more comfortable usage. You can define global filters that are filtering all Business Cases automatically too.
	×	Email import	Importing Excel data directly by email - send Excel sheets using email attachments and Apparo will import the Excel data directly into the database including file uploads. No web browser is necessary, just an email.
	\succ	Email	An eMail Business Case is a definition of an email text including usage behavior and can be used in another Business Cases of type 'table' or 'single' only. In these Business Cases it is possible to define buttons that can use this eMail Business Case.
	>	Action	Purpose of Action Business Case is to execute scripts or database procedures that can be called from a report/HTML page. Usage of AJAX and Javascript for automatically executing in the background is possible too.
CANCEL			

12.4 Defining the main settings

If the used action contains SQL commands, you need to select a databse connection.

Run Close Save Cancel	Main settings	
Main settings		
	Identifier / Short name	Action BC with output
Header	Business Case name	Action BC with output
Footer	Database connection	SAMPLES
Visual settings		
Actions	Show output	This Action Business Case will display output
Buttons	Close automatically	
Variables	Business Case security group	
Link into Portal		
	Notes	calling an Action BC that is calling a script and showing Output.

12.5 Header & Footer

Main settings	Title & Description	Language	Title				Description	
Header			Titel des Act	ion BC		V	Der Action BC ruft eine Datenbank-Procedure auf und wa einen OK-Klick	artet auf V
Footer		German						
Visual settings								
Actions			Title of Actio	n BC		V	The Action bc is calling a database procedure und is wait button click	ing for ok V
Buttons		English						
Variables								
Link into Portal	Title style	Font face	Size	Style	Align	Colour		
		Arial	• 14	Bold	👻 Left	#000000	m ²	
	Description style	Font face	Size	Style	Align	Colour		
		Arial	- 12	Normal	👻 Left	#000000	m	
	Background colour	#FFFFFF	a c					
	Left logo URL							1
	Right logo URL							

12.6 Visual settings

Contains the texts and visual settings of the message windows.

The description message is displayed when the BC action is started. The "Please wait" message is displayed while the action is being executed. Action output text contains the text of the Action has finished message and may contain return values.

Hides the blue application header

Window background

Defines the color of the window background

Window background image URL

Shows a background image instead of the color.

12.7 Actions

Contains the actions and gives the selection Automatic execution of

12.7.1 Javascript commands

Allows server sided JavaScript and the use of variables and all custom Javascript methods - <<see here>>

 Enable Pre Business Case action 	execution			
Pre Business Case executio	on (allows to run automatically a script or database functi	ion/procedure if the user is starting	the Business Case)	
Automatic execution of	Javascript commands	✓ for all users	2 Ø	
Javascript definition				V
Return value variable	<%RETURN_VALUE%>	*		

12.7.2 SQL commands

Allows the direct use of all SQL commands

 Enable Pre Business Case action 	n execution			
Pre Business Case execution	on (allows to run automatically a script or database fun	ction/procedure if the user is startin	ng the Business Case)	
Automatic execution of	SQL commands	✓ for all users	• 0	
	INSERT into Values (<%VARIABLE1%>,<%VARIABLE2%>,<%VA	RIABLE3%>)		V
SQL definition				
ode demnion				
Return value variable	<%RETURN_VALUE%>		•	

12.7.3 Database stored procedures and functions

 Enable Pre Business Case action 	on execution		
Pre Business Case execut	ion (allows to run automatically a script or database funct	tion/procedure if the user is st	rting the Business
Automatic execution of	Database procedure	✓ for all users	• 😯
Name	return COMMENT_FUNC('Action BC calling', <%REPORT_VAR1%>)		v
Return value variable	<%RETURN_VALUE%>		•

To call a database function or procedure:

[calling convention] procedure/function_name (argument1, argument2, ..., argumentN).

ATTENTION: Please use the same upper and lower case for schema and procedure/function as defined in your database.

If the database connection of this procedure/function is the same as the one for the business case, then the procedure/function will be executed within the same database transaction.

The procedure may not commit or rollback the existing transaction, but it may start its own inner (named) transaction (if supported by the database) or use savepoints.

For character or string arguments, use the ' character to enclose the argument. Use at least one space between [calling convention] and procedure name.

Your parameters can include Apparo variables, for example: <%USERNAME%>, <%CURRENT_DATE%>, <%BC NAME%>, <%PRIMARY KEY%>.

Do not enclose Apparo variables with apostrophes or quotes. For the complete list of variables, see the Variables chapter.

[Calling convention] is one of these:

If you are using an Oracle or IBM DB2 database:

• return - For calling a stored function that returns a value.

If you are using an MS SQL Server database:

- Calling functions on SQL Server is not supported. It is possible to have a return value from a procedure, but [Calling convention] must be empty in this case.
- Please use "SET NOCOUNT ON;" in the beginning of your SQL Server procedure. Then it is possible to use SQL commands in your procedure without affecting the return value.

If you use a Sybase database:

• select - For calling a stored function that returns a value.

If you are using a Teradata database:

- return macro For calling a Teradata macro that returns a value.
- macro for calling a Teradata macro that does not return a value
- return For calling a stored function that returns a value.

If you are using an SAP HANA database:

• select - For calling a stored function that returns a value.

Hint: [Calling convention] must be empty when you call a stored procedure.

12.7.4 Exceuting anonymous block

The anonymous block serves as database procedure, which can be executed without having direct database access.

 Enable Pre Business Case action 	execution			
Pre Business Case executio	n (allows to run automatically a script or database function	on/procedure if the user is starti	ing the Business Case)	
Automatic execution of	Anonymous database block	for all users	0	
Anonymous database block definition				V
Return value variable	<%RETURN_VALUE%>		*	

12.7.5 Calling a script or batch file on the server

You can call all script files located in the scripts folder as set in the Apparo Configuration Manager.

Supported are:

- Batch and executable files (.bat, .sh, .exe)
- SQL files (.sql)
- JavaScript files (.js)

✓ Enable Pre Business Case action €	execution			
Pre Business Case execution	n (allows to run automatically a script or database function	on/procedure if the user is s	starting th	he Business Case)
Automatic execution of	Script on server (batch file, SQL file or Javascript file)	✓ for all users		- Ø
Name	sendOrderToSupplier.bat	F		
Parameters for batch file only (separated with space)	<%VARIABLE1%>,<%VARIABLE2%>		V	
Return value variable	<%RETURN_VALUE%>		*	

12.8 Buttons

Here you can enable/disable buttons.

Run Close Save Cancel	Buttons

Buttons				
Variables				
Link into Portal				

By clicking the linked button type, you can change the button title for each installed language:

OK button setting	s			
Label		Language	Label	
		German	ОК	V
		English	OK	V
De dire et UDI				V
Redirect URL				v
Gap (right)		12		
ок	CANCEL			

Also possible: Defining a redirect URL, which redirects the user after clicking

12.9 Variables

When calling the Action BC via URL, all parameters passed to the Action BC require their own report variable

Run	Close	Save	Cancel	User defir	ed variables	Internal variables
lain se	tings			+ Add	× Delete	
eader				User de	fined variables	i -
Footer				Varia	ble name	
isual s	ettings			No user de	efined variables four	nd
ctions						
Buttons						
Variable	25					
nk into	Portal					

Example:

We want to pass one parameter and created one report variable:

User defined variables	Internal variables
+ Add × Delete	
User defined variables	
Variable name	
> <%Report_Var_1%>	

Syntax:

&Report_Var_1=VALUE

The URL would look like this:

https://demo.apparo.services/demo/pages/businessCases/userInterface/businessCase.xhtml?bc=Action+BC +with+output&Report_Var_1=VALUE

The variable contains the value VALUE and can be used as parameter when calling the action.

12.10 Link into portal

12.10.1 Tab Main

r ten: Thaf a teophol te make a disabilitarie
r maling a faabbaart.

Allows to link the Action BC in the portal under the defined name

12.10.2 Tab Advanced

Run Close Save Cancel	Link into Portal	
Main settings	Select portal folder	
Header	🖙 Demo	
Footer	Main Advanced	Tiles
Visual settings		
Actions	Open in	Same window
Buttons		O Remain window
Variables		✓ Newtab
Link into Portal		Here you can select The entry's spering is a new tab, the same window or in a custom sized new window.
	Additional Parameters Security groups	AFE_PRopClutz_1+ Space for USE_presentations = g Resentation-types date there the expected format is explain, e.g. 12.31 2018 or 133.45 Types work to 61 a report-analyte of types date these expected format is explain, e.g. 12.31 2018 or 133.45
	Security groups	Correct separated bit of regards decardy groups to see the portil entry. Attention: It is possible to run a Basiness Case using an URL: Therefore Ex nonseary's secure the Baseness Case too using security setting in the Basiness Case too!
	URL	htps://demo.apparo.senices/Stemo/appar/builness/Caseniaen/Interativainess/Case.html?pc=/cdca=40=vetiin=upparo.senices/Stemo/Apparo.senices/Stemo
		2 You can use this URL for naming this Business Case directly without using the portiol first. You can change the beaCList parameter to define another website that must be called after this Business Case is closed pressing closestance/hulton.
	CREATE PORTAL ENTRY	

Open in

Contains settings how to open the link

- Same window
- Own small window
- New tab

Additional Parameters

Additional Parameters &FE_Report_Var_1=

Automatically contains all used report variables

Other URL parameters are: e.g. &insertMode=true or country_id=en

If you want to fill a report variable of type date or number then the expected format is English, e.g. 12.31.2028 or 123.456789

Security groups

Comma-separated list of required security groups to view this portal entry. Attention. It is possible to execute a business case via a URL. Therefore it is necessary to secure also the business case via security settings in the business case itself.

12.10.3 Tiles

If you use the tile view, you can define the visual appearance here.

Run Close Save Cancel	Link into Portal
Main settings Header Footer	Select portal folder
Visual settings Actions Buttons	Ter size
Variables Link into Portal	Snat Medium Large
	Extra large
	Select the desired size of the life in the life new.
	The background image into a Background image of the like in the like view.
	Logo Into all tops if the top left correct of the tile. The image has to be in the desired formatister. You can use relative paths like disclores too.
	CREATE FORSIL ERRY

13 Business logic serverside

With Apparo Fast Edit it is possible to define your own business logic or smaller programs:

- Logic within a script variable
- Logic within a Javascript script
- Logic within the Row validator

The programming language used is JavaScript, which is executed on the server side.

13.1 Example of a script variable:

Variable for Business Case

Variable name	<%GROUPS%>		*	
Variable description				
Variable value	Data output format			
Script body				
Script language :	javascript			
You can see a deta	iled JavaScript language descripti	on including examples by clicking the qu	estion mark icon placed next to the editor.	
	nt to use a Apparo variable in Jav	ascript that contains text then you must	use it in quotes,	
for example:	e('<%TEXT1%>','<%TEXT2%;	'.'text')		
	nust return value true or false ther			
1 var groups	= afe.getGroupsByRegex	(1 +1).		V 🔿
2 var result	<pre>= 'Security groups of 1</pre>			
3 var i; 4 var group;				
	<pre>i < groups.length; i++) groups[i];</pre>	{		
2 2	result + group + ', ';			
	ng the calculated result	; from script		
10 result; 11				
12				
13 14				
15 16				
17				
18 19				
20				
SYNTAX CHECK	l			
 Calculate the va 	riable value before each usag	again (
ок	CANCEL			

× ?

13.2 Example of a JavaScript script file

This file can be called up by Apparo Fast Edit and is saved as a file on the server:

-> · 🛧 🖡	« Win	dows (C:) > Program Files > ApparoAdmin >	FastEdit ≯ user_scripts	~ U	Search user_	scripts

13.3 Example of the Row-Validator

Data row validation

```
Data row validator

var a = afe.resolveVariable('FORECAST');

var b = <$FORECAST2$>;

var c = <$FORECAST3$>;

var c = <$FORECAST3$>;

// prepare empty result, what means that row data is valid

var result = '';

if (a < (b+c+d+e)) {

if ('<$LANGUAGE$>' == 'en') {

result = 'Sum of quarters is greater than the amount per year';

} else {

result = 'Summe der Quartale ist größer als das Jahr'; }}

if (a == null || a==0) {

if ('<$LANGUAGE$>' == 'en') {

result = 'Bitte geben Sie die Anzahl je Jahr an'; }}

// return the result

// return the result

// result;

// SYNTAXCHECK
```

13.4 Additional Apparo Methods

- afe.callClassMethod(className, methodName, args) calls a compiled Java class. This must be stored on the server side.
- afe.createFile(pathName, content) Creates a file with the provided content.
- afe.executeCommand(command, homeDir) Executes the specified cmd command. Example:

afe.executeCommand('C:\\Program Files\\Apparo\\FastEdit\\user_scripts\\batchfile.bat "20"','C:\\Program Files\\Apparo\\FastEdit\\user_scripts\\');

- afe.executeSql(sqlQuery) Executes an SQL command and returns the first column of the first row
- afe.executeSqlInsert(sqlInsert) executing a SQL insert and returning true = success, false=failure
- afe.executeSql(sqlQuery, parametersArray) Executes an SQL command with a parameter list and returns the first column of the first row.
- afe.executeSqlSelect(sqlSelect) Executes the specified SQL query and returns the result as a two-dimensional object array of rows and columns.
- afe.exportAllRows(filename) Exports all visible (i. e. all filters are considered) data rows into an Excel file on the server side. Supported output formats: xls, xlsx and csv. The use of variables is possible.
 Example: afe.exportAllRows (' <%AFE_HOME_HOME_DIR%>/data-export/<%AFE_CLIENT_ID%>/<%AFE_BC_ID%>_<%DATE_TIMESTAMP_SHORT%>. xlsx');
 Attention: Please use \\ as path separator, e. g. afe.exportAllRows (' c: \\filename. csv');
 UNC is possible, example: \\\servername\\share1\\file.csv
- afe.exportSelectedRows(filename) Exports all selected data rows into an Excel file on the server side. Supported output formats: xls, xlsx and csv. The use of variables is possible.
 Example: afe.exportSelectedRows (' <%AFE_HOME_HOME_DIR%>/data-export/<%AFE_CLIENT_ID%>/<%AFE_BC_ID%>_<%DATE_TIMESTAMP_SHORT%>. xlsx');
 Attention: Please use \\ as path separator, e. g. afe.exportAllRows (' c: \\filename. csv');
 UNC is possible, example: \\\\servername\\share1\\file.csv
- afe.getGroupsByRegex(regex) Returns an array of security group names corresponding to the' regular expressions' argument. Example: afe. getGroupsByRegex (' CLIENT. *')
- afe.getSessionParameters() Reads the Cognos session parameters and returns them as a 2-dimensional string array
- afe.resolveVariable(variableName) Returns the value of a variable
- afe.runEmailBc(emailBusinessCaseId) Defines the e-mail business case to be executed, i. e. an e-mail is sent..

You will find examples of use when you call the ?-icon in the script window.:

13.5 Usage examples for methods of Apparo in JavaScript

13.5.1 Custom script example returning a string value based on security group

```
var groups = afe.getGroupsByRegex('.*');
var result = 'Security groups of the current user: ';
var i;
var group;
for(i = 0; i < groups.length; i++) {
  group = groups[i];
  result = result + group + ', ';
}
// returning the calculated result from script
result;
```

13.5.2 Custom function example returning a string value

```
// declaring a function
function myCustomFunction() {
  var result = 'defaultStringValue';
  // complext algorithm to evaluate the result of the method
  return result;
  }
// calling the declared function to return a value from script
```

myCustomFunction();

13.5.3 Example using custom functions declared in file

// If we have our custom functions declared in the text file we can use it in our script variable. // In our example we have a file 'C:\scripts\myFunctions.js' with content: 'function myFunctionPlus(a, b) {return a + b;}' // We can 'include' this content into the script variable as follow: <%FILE CONTENT(C:\scripts\myFunctions.js)%>

// now we can use declared function
var x = myFunctionPlus(2, 1);

// variable 'x' now has value 3 x;

13.5.4 Example using Fast Edit variables

// working with string variable, and adding a custom postifx
var result = '<%USER_NAME%>' + 'postfix';

// modifiying a result of sql variable returning a numeric variable
var result = <%SQL_COUNT_VAR%> / 100;

Example using Fast Edit LANGUAGE variable in a column name:

// In this example Fast Edit must read the content of the widget reference variable <%PRODUCT_EN%>
or <%PRODUCT_DE%>.
// PRODUCT_EN for a user with english language and
// PRODUCT_DE for a user with german language:

var rc; rc = '<%PRODUCT_<%LANGUAGE%>>';

13.5.5 Example for calling a java class with return value

// In this example Fast Edit creates an instance of 'MyCustomClass' class and executes the 'myCustomMethod' method var result = afe.callClassMethod('MyCustomClass', 'myCustomMethod'); result;

13.5.6 Example for calling a java class with arguments and return value

// In this example Fast Edit creates an instance of 'MyCustomClass' class and executes the 'myCustomMethod' method var args = []; // create new array args[0] = "stringValue"; args[1] = 256; // passed to java as java.lang.Double args[2] = (new Date()).getTime(); // passed to java as java.lang.Double

var result = afe.callClassMethod('MyCustomClass', 'myCustomMethod', args);
result;

13.5.7 Example for dynamic variable resolving

// In this example Fast Edit creates an instance of array and set current number of milliseconds (since
1.1.1970) for each element separately.
var args = []; // create new array

var i; for(i = 0; i < 10; i++) { args[i] = afe.resolveVariable('TIME_MS'); }

13.5.8 Example for working with date widget variables

// In this example we will compare current Date with widget Date
var my_date_widget = afe.resolveVariable('DATE_WIDGET');
var current date = new Date();

//for explicit date usage, e.g. December 24, 2016 at 6:30pm use format: Date(year, month-1, day, hour, minute, second, millisecond) //var date = new Date(2016,11,24,18,30,0,0);

var text;

```
if (my_date_widget == null) {
  text = 'my date widget is empty';
  }
  else if (my_date_widget.getTime() > current_date.getTime()) {
  text = 'My date widget value is after current date';
  }
  else if (my_date_widget.getTime() < current_date.getTime()) {
  text = 'My date widget value is before current date';
  }
  else {
   text = 'The dates are equal';
  }
}</pre>
```

text;

13.5.9 Example for getting the name and content of the current widget

```
// In this example Fast Edit is reading the name and content of the current widget.
// This is helpful for defining the background colour of many similar widgets or defining default
value/constant value without creating many different variables.
var current_widget= '<%CURRENT_WIDGET_NAME%>';
var current_widget_content = afe.resolveVariable(current_widget);
var red_colour_background = 'false';
```

```
if (current_widget_content > 100) {
  red_colour_background = 'true';
}
else if (current_widget_content < 50 && current_widget == 'MEASURE1') {
  red_colour_background = 'true';
}</pre>
```

red_colour_background;

13.5.10 Example for storing content into a file

// In this example Fast Edit store text content into 'myFile.txt' file.
var fileContent = 'This is file content.';
var success = afe.createFile('c:\\files\\myFile.txt', fileContent);

13.5.11 Example for executing a SQL query

// In this example Fast Edit executes SQL query to retrieve 'user_id' value of 'John Smith' in table 'MyTable'. var user_id = afe.executeSql("select id from MySchema.MyTable where sales_name='John Smith''');

13.5.12 Example for executing a SQL select

```
// In this example Fast Edit executes SQL select to retrieve 'id', 'name' and 'price' values of all products in
table 'MyProduct'.
var productsArray = afe.executeSqlSelect('select id, name, price from MySchema.MyProduct');
var i;
var rowData;
var rowData;
var name;
var name;
for(i = 0; i < productsArray.length; i++) {</pre>
```

```
rowData = productsArray[i];
id = rowData[0];
name = rowData[1];
price = rowData[2];
}
```

13.5.13 Example for executing a SQL select and storing result into XML file

```
// In this example Fast Edit executes SQL select to retrieve 'id', 'name' and 'price' values of all products in
table 'MyProduct' creates xml String and stores it into XML file.
var productsArray = afe.executeSqlSelect('select id, name, price from MySchema.MyProduct');
var i;
var rowData;
var xmlString = '<?xml version="1.0" encoding="UTF-8"?>\n<products>';
var xmlRow;
for(i=0; i < productsArray.length; i++) {
 rowData = productsArray[i];
```

```
rowData = productsArray[1],
xmlRow = '\n\t<product id=''' + rowData[0] + ''' name=''' + rowData[1] + ''' price=''' + rowData[2] + ''' />';
xmlString += xmlRow;
}
```

```
xmlString += '\n</products>';
```

```
var success = afe.createFile('c:\\myXmls\\products.xml', xmlString);
success;
```

13.5.14 Example for executing a SQL query with parameters

// In this example Fast Edit executes SQL query with parameters.
var params = []; // create new Array
params[0] = 'John Smith';
params[1] = 'Germany';
var user_id = afe.executeSql('select id from MySchema.MyTable where sales_name=? and country=?',
params);

13.5.15 Example for executing a command

// In this example Fast Edit executes command.
var returnValue = afe.executeCommand("c:\\scripts\\myfile.bat","c:\\scripts");

13.5.16 Example for making a row read-only

// In this example we want to make a data row read-only when the PROJECT_COMPLETITION_DATE widget has value of a date in the past (the project is finished).

// First we must create a variable <%ROW_READONLY_VAR%> which will be used here. // The goal is to return the same date as the widget if it is older then today, otherwise we will return dummy date.

// Returning date must be represented as string with proper format.

// dummy date in format of MM.dd.yyyy
var result='01.01.1990';

// today's date
var current_date = new Date();

// We need to read string value of PROJECT_COMPLETITION_DATE widget. // If the widget is storing timestamp then it's string value has format 'yyyy-MM-dd HH:mm:ss.S' e.g. '2015-12-24 18:00:00.0' // If the widget is storing number then it can be e.g. '42' or '42.1' var end date string = '&It;%PROJECT COMPLETITION DATE%>';

// If the PROJECT_COMPLETITION_DATE is not specified then we don't want to make row read-only.
// If it has value then we must compare that date with today's date.
if (end_date_string.length > 0) {

// Here we are constructing the Date object from the string in order we can compare two dates.
var end_date = new Date();

// we must set correct Year, Month and Day from the end_date_string
end_date.setFullYear(end_date_string.substring(0,4));
// watch out here: months are calculated from 0 so we must decrease it's number
end_date.setMonth(end_date_string.substring(5,7)-1);
end_date.setDate(end_date_string.substring(8,10));

// now we can compare the dates
if (end_date < current_date) {

// again, we must use correct format: MM.dd.yyyy
var end_date_string_EN_format = '';
end_date_string_EN_format += end_date_string.substring(5,7);
end_date_string_EN_format += '.';
end_date_string_EN_format += end_date_string.substring(8,10);
[185]

```
end_date_string_EN_format += '.';
end_date_string_EN_format += end_date_string.substring(0,4);
```

```
result = end_date_string_EN_format;
}
```

// return the result
result;

}

13.5.17 Example for reading Cognos session parameters

//In this example Fast Edit reads Cognos session parameter named 'userClassID'.

//Declaration of the result variable.
var result = ";

//Call Fast Edit function that reads all the Cognos session parameters and return them as 2-dimensional String array. var sessionParameters = afe.getSessionParameters();

var i = 0;

//Iterating over all returned parameters
for(i; i &It; sessionParameters.length; i++) {

```
//If parameter's name (second dimension with index 0) is 'userClassID' then we assign parameter's value
(second dimension with index 1) into 'result' variable.
if(sessionParameters[i][0] == 'userClassID') {
    result = sessionParameters[i][1];
  }
}
```

//Return the result
result;

13.5.18 Example for exporting all Business Case data to file

// In this example Fast Edit exports all Business Case data to file on filesystem and returns whether
operation was successful.
// Note: Backslash symbols must be escaped, i.e. '\\' must be used.

```
var result = afe.exportAllRows('C:\\Users\\Administrator\\Documents\\allDataExport-
<%DATE_TIMESTAMP_SHORT%>.xlsx');
result;
```

13.5.19 Example for exporting selected Business Case data to file

// In this example Fast Edit exports selected Business Case data to file on filesystem and returns whether
operation was successful.
// Note: Backslash symbols must be escaped, i.e. '\\' must be used.

var result = afe.exportSelectedRows('C:\\Users\\Administrator\\Documents\\selectedDataExport <%DATE_TIMESTAMP_SHORT%>.xlsx'); result;

13.5.20 Example for running Email Business Case

// In this example Fast Edit sends an e-mail for each modified row of the Table Business Case.

// First we must create an Email Business Case (e.g. 'NotificationEmailBc') that will be used for email sending.

// We can use variables of the Table Business Case in the Email Business Case definition.

// Next we must create a script file (e.g. 'sendingEmailNotification.js') containing single line:

afe.runEmailBc('NotificationEmailBc');

// Then we must enable 'Enable Post row update execution' feature in the Table Business Case, set "Automatic execution of" to "Script on server" // and choose the 'sendingEmailNotification.js' in the drop-down list 'Name'.

// With such Business Case setup an email will be send every time a row will be updated,
// including Excel import (manually or using automatic server-side import or Business Case Email Import)

14 Business logic & widget control in the web browser

Own JavaScript business logic can be executed automatically when the user is in the

- Single Business Case or
- Table Business Case

in insert or editing mode:

- check and uncheck a **checkbox**
- exits an **input field** (or pressing the Enter key)
- selects a value in a lookup widget (for all tables)

After that, a JavaScript routine can be automatically executed in the browser to change other widget values:

- Widget Label
- Widget Label with variables
- Input field widget
- Checkbox

Attention: Only the widgets of the **current** data row can be changed, as well as all calculation widgets.

Example:

- 1. The user sets a checkbox or changes a number in an input field and exits this input field.
- 2. The self-defined JavaScript routine is started

The routine can now read values from other widgets and change the widget value of the type label, label with variables or input field without a submit.

In a table business case, the current values of a column can also be summed up and output in a calculation widget, for example.

Limitations

The execution in the web browser naturally results in some restrictions:

- Variables can only be used to a limited extent, they are calculated on the server side.
- You could start an Action Business Case with window.open, but the (intermediate) results of the calculations cannot be saved in this way, as access to the widget references of the calculations is missing.

14.1 JavaScript Selektor ID

For unique assignment, each widget has a JavaScript selector ID.

The JavaScript selector ID can be found in the widget settings under Widget Type:

Widget settings of database column PLAN_YEAR

Widget type	Mapping & Other	Features	Visual	Help texts	Data output format
Eingabefeld		have defined as		eld with one line.	
Textareal		input neid:	Simple input n	eid with one line.	
Checkbox					
Einfaches Au	ıswahlfeld (nur für die				
	vahifeld (für alle Tabellen)				
Mehrfachaus	wahl				
Label					
Label mit Var	iablen				
Platzhalter &	Titel				
Business Ca	se Link				
Datei Upload	/Download				

OK CANCEL

To copy the ID, you can use the button to the right of the ID.

14.1.1 Structure of the ID

The selector ID looks like this: .jsID E 0 0

The first part of the ID is the abbreviation for JavaScript ID .jsID_E_0_0

The second part of the ID describes the area in which the widget is used .jsID_E_0_0

E stands for edit area and C stands for calculation area.

The two digits stand for the respective column and number in which the widget is used .jsID_E_0_0

The counter starts at zero and is always incremented by 1.

The first digit identifies the column in which the widget is located and is used in Single Business Cases. In

Table Business Cases, the counter is always 0, as no columns are used.

The second digit represents the consecutive numbering of the widgets.

If you change the order of the widgets, the ID also changes.

14.2 Use in a Table Business Case

14.2.1 Activating the feature

Activate the feature " Defining own client-side JavaScript" under Features in the widget settings:

fain settings + Acc								
Please select all fea	itures that you want to use in this Business Case	•:

14.2.2 Available JavaScript methods

The general format for **get** and **set** methods:

getAfeWidgetValue(targetElementSelector)

must be extended in the table business case in the edit area as follows: getAfeTableWidgetValue(sourceElement, targetElementSelector).

Table is a hint for the routine and sourceElement refers to the current row and is always 'this'.

Goal	Command
Read the value of a widget of the current row, Value is a number	getAfeTableWidgetNumValue(this, '.jsID_E_0_1');
Read the value of a widget of the current row, Value is a string	<pre>getAfeTableWidgetStringValue(this, '.jsID_E_0_1');</pre>
Write to a widget of the current row, Value is a number	<pre>setAfeTableWidgetNumValue(this,'.jsID_E_0_2', calcValueNum);</pre>
Write to a widget of the current row, Value is a string	setAfeTableWidgetStringValue(this,'.jsID_E_0_2', calcValueNum);
Read the value of a calculation widget , Value is a number	getAfeWidgetNumValue('.jsID_E_0_1');
Write a value to a calculation widget, Value is a string	<pre>setAfeWidgetStringValue('.jsID_C_0_1', 'CHANGED');</pre>
Reading a Lookup Widget Label	var myLabelValue = getAfeTableWidgetLookupLabel(this, '.jsID_E_0_3');
Read/aggregate all numeric values of a column of the current page	<pre>getAfeTableColumnFunction('.jsID_E_0_9', 'sum') ; getAfeTableColumnFunction('.jsID_E_0_9', 'min') ;</pre>
	<pre>getAfeTableColumnFunction('.jsID_E_0_9', 'max'); getAfeTableColumnFunction('.jsID_E_0_9', 'avg');</pre>
	Null values are calculated with 0-values

14.3 Use in a Single Business Case

14.3.1 Activating the Feature

Activate the feature "Defining own client side JavaScript" under Features in the widget settings:

		Actions and scripts Widget cate calculations Migget cate calculations Automatic scripts and database procedures Automatic scripts and database procedures Enable Pre Rusness Case execution					
	Please select all features that you want to use in	this Business Case:

14.3.2 Available JavaScript methods

Command
<pre>getAfeWidgetNumValue('.jsID_E_0_1');</pre>
<pre>getAfeWidgetStringValue('.jsID_E_0_1');</pre>
setAfeWidgetNumValue('.jsID_E_0_2', calcValueNum);
<pre>setAfeWidgetStringValue('.jsID_E_0_2',</pre>
calcValueNum);
getAfeWidgetNumValue('.jsID_E_0_1');
<pre>setAfeWidgetStringValue('.jsID_C_0_1', 'CHANGED');</pre>
var myLabelValue = getAfeWidgetLookupLabel(
'.jsID_E_0_3');

14.4 Read/Write Widget Values

14.5 Reading widget values

With the method **getAfeWidgetValue(JavaScriptSelektorID)** you can read any widget value. The JavaScriptSelektorID identifies the widget whose value we want to read.

For numeric values (numbers) use getAfeWidgetNumValue and For string values use getAfeWidgetStringValue.

14.5.1 Writing widget values

With the method *setAfeWidgetValue(JavaScriptSelektorID, value)* you can write values into widgets. The *JavaScriptSelektorID* identifies the widget we want to write to and **value** identifies the value (e.g. a number) to write.

For numeric values (numbers) use *setAfeWidgetNumValue* and For string values (strings) use *setAfeWidgetStringValue*.

14.5.2 Example function

In this example, the value of the widget with reference ID **.jsID_E_0_0** is read and the value of the widget * 2 is stored back into the widget **.jsID_E_1_2** when the user exits the widget **.jsID_E_0_0**.

```
$(document).on('change', '.jsID_E_0_0', function(){
    var myValue = getAfeWidgetNumValue('.jsID_E_0_0');
    setAfeWidgetNumValue('.jsID_E_1_2', myValue * 2);
})
```

14.5.3 In detail

\$(document).on('change', '.jsID_E_0_0', function()

Starts a JavaScript *function()* when a value in the widget '.*jsID_E_0_0*' in the web browser *\$(document)* is changed *on('change')*.

Attention: If the widget is a lookup (for all tables), then the setting "User can enter into widget for selecting a value" must be switched off.

The content of the JavaScript function is enclosed in the curly brackets.

{ var myValue = getAfeWidgetNumValue('.jsID_E_0_0');

Defines var and fills the JavaScript variable myValue with the value of the widget '.jsID_E_0_0'.

```
setAfeWidgetNumValue('.jsID_E_1_2', myValue * 2); }
```

Writes the content of the JavaScript variable *myValue* multiplied by 2 * 2 into the widget '.*jsID_E_1_2*' as numeric value *setAfeWidgetNumValue*

Note

Numeric value is important here, the system can thus automatically use language-specific number formats, otherwise there would be problems e.g. when using different decimal separators (123.45 and 123,45)

14.5.4 Use in Apparo

Run Close Save Cancel	Automatic scripts and database procedures	📩 Features
Main settings	Defining own client side Javascript	
Standard buttons Filter data output	The controlled juscascipt with the part of the verb investor object and will be exceeded in the verb investor of the verb investor of the part of the verb investor of the verb i	
Variables Editing of data rows	\$/document).at(::https://staff.com/staff	N.
Automatic scripts and database procedures		
Auditing of data changes		

14.6 Possibilities of a Checkbox

Checkboxes can be set independently of the used value (usually 0 and 1 or Y and N). With true the checkbox is checked, with false the checkbox is unchecked.

setAfeWidgetStringValue('.jsID_E_0_3', true);

This call sets the checkmark (=true) in the checkbox widget with the reference '.jsID_E_0_3'. Since true is a string we use the method setAfeWidgetStringValue.

Checkboxes can also be easily hidden.

In the following example, the checkbox is hidden depending on its value:

Example:

```
$(document).on('change', '.jsID_E_0_3', function(){
    var myValue = getAfeWidgetNumValue('.jsID_E_0_3');
    if(true == myValue) {
```

document.querySelector('.jsID_E_0_4').parentElement.parentElement.parentElement.parentElement.styl e.display = "none";

} else {

document.querySelector('.jsID_E_0_4').parentElement.parentElement.parentElement.parentElement.styl
e.display = "table-row";
}
};

If the checked checkbox is set, the checkbox widget .jsID_E_0_4 is hidden or otherwise (re)displayed.

14.7 Disabling Row Selection Checkbox

The row selection checkboxes that are displayed when, for example, the "Delete rows" feature is active or when using custom buttons that work for all selected rows, can be disabled row by row depending on widget values (or calculations).

These rows can then not be deleted or the action on the button cannot be triggered for this row.

Method:

hideTableRowSelection(JavaScriptSelectorId, 'widget value');

hideTableRowSelection('.jsID_E_0_5', 'test');

In this example, all rows whose value of the widget with ID .jsID_E_0_5 contains the value 'test' become unselectable.

14.7.1 Application example

Widget settings

In a business case, rows should be non-deletable depending on the workflow status "Ready for approval".

Ye	ar Mont	h	Office	Product line	Product	My status	Revis	on status	Plan data	Plan2	Pla
	2017	1	London office	Trousers	Talli	Ready for approval	Open	-	400	7	500
	2017	1	London office	Trousers	Talli	open	Open	-	555	5	0

Lookup widgets can be used directly, but assuming the selection checkbox is to be hidden based on a calculation, we need to output the result of the calculation in a 'label with variables' type widget beforehand. Therefore, we output the value of the lookup widget here as a substitute in a label with variables, which can optionally also be hidden:

magorootai	.90						
Widget type	Mapping & Other	Features	Visual	Help texts	Data output format		
Label value		<%STAT	US_ID%>				V
							*
Hide value of this	widget if used variable is e	mpty					
ОК	CANCEL						

As label value we simply use the widget reference variable of the status widget. In a calculation, 'true' or similar would usually be output.

Run Close Save Cancel	Automatic scripts and database procedures	🔥 Features
Main settings	Defining own client side Javascript	
Standard buttons	The complete Javascript will be part of the web torowser output and will be executed in the web torowser only. You can use variabilies to 10 tasing larger routines then you can use <4/FLE_CONTENT(file and +ame)%> and store the script server side. You can showhild calk widdly beginning on user behaviou. See our paids of getting details.	
My own action buttons	You can showhide/calc widgets depending on user behaviour. See user guide for getting details.	
Filter data output		
Variables		
Inserting of new data rows		
Editing of data rows		
Delete data rows manually		
Bulk data update		
Excel import		
Excel export		
Automatic scripts and database procedures	x	
Auditing of data changes		
Data history		

In the window "Define own client side Javascript" we enter the following function:

```
function onAfeFormReload() {
  $(document).ready(function(){
    //for multiple widgets or values the method can be called more then once.
    //Note: function onAfeFormReload() can be used only once.
    hideTableRowSelection('.jsID_E_0_27', '2');
    })
}
```

In detail:

function onAfeFormReload() {

Calls a special Apparo function that, as soon as the business case starts or is reloaded (e.g. when OK is clicked), starts the following JavaScript:

\$(document).ready(function(){

Once the web page has finished loading, start a function with the following command(s):

hideTableRowSelection('.jsID_E_0_27', '2');

Hide the selection checkbox if the value of the widget of type 'Label with variables' '.jsID_E_0_27' is equal to two (lookup ID value for "Ready for approval").

Result:

Year Month	Office	Product line	Product	My status	Revision status	Plan data	Plan2 Pla
2017 1	London office	Trousers	Talli	Ready for approval	Open -	4007	500
2017 1	London office	Trousers	Talli	open 💌	Open -	5555	0

The user can now no longer delete this row.

14.8 Download file of a File Up/Download Widget

You can control a file up/download widget and start the download of the stored file automatically:

// In this example a file stored in the file widget will be automatically downloaded after Single Business Case is started.

```
$(document).ready(function() {
    downloadAfeFileWidget('.jsID_E_0_3');
})
```

14.9 Show and hide a widget

For a Table Business Case:

- hideAfeTableWidget(this,<javascript selector ID>);
- unhideAfeTableWidget(this, <javascript selector ID>');

For a Single Business Case:

- hideAfeWidget<javascript selector ID>);
- unhideAfeWidget(<javascript selector ID>);

Note: Even if the widget is hidden, the value is stored in the database destination table.

Example:

```
$(document).on('change', '.jsID_E_0_2', function() {
```

```
let ID = getAfeTableWidgetNumValue(this, '.jsID_E_0_2');
if(ID == 2022) {
    hideAfeTableWidget(this, '.jsID_E_0_12'); // hide widget of current row if year is 2022
  }
  else {
    unhideAfeTableWidget(this, '.jsID_E_0_12'); // show widget of current row
  }
});
```

14.10 Possibilities of Lookup Widgets

Lookup widgets can only be read, but not set.

14.10.1 Lookup key values

Lookup key values can be read like this:

In the table business case

getAfeTableWidgetNumValue(sourceElement, targetElementSelector)

var myLabelValue = getAfeTableWidgetNumValue(this, '.jsID_E_0_4');

In the single business case

getAfeWidgetNumValue(targetElement)

var myLabelValue = getAfeWidgetNumValue('.jsID_E_0_4');

14.10.2 Lookup output values (Label)

The lookup output values can be read like this:

In the table business case

getAfeTableWidgetLookupLabel(sourceElement, targetElementSelector)

var myLabelValue = getAfeTableWidgetLookupLabel(this, '.jsID_E_0_4');

In the single business case

getAfeWidgetLookupLabel(targetElement)

var myLabelValue = getAfeWidgetLookupLabel('.jsID_E_0_4');

14.11 Aggregate all values of a column in a table Business Case

As of version 3.3, there is an option to easily enable this feature without calculation widgets in the <u>widget</u> <u>settings</u>.

It is possible to perform calculations over all used rows of a widget (=column).

The column must be numeric.

All values of only the current page (=all visible data rows) are taken into account. The sum can be output e.g. in a calculation widget.

Product	Sum year	January	February	March	April	Мау	June	July	August	September	Oktober	November	December	Workflow	
T-Shirt Vienna	3,000.00	0.0	0.00	200.00	300.00	2,000.00	300.00	120.00	200.00	-30.00	-30.00	-30.00	-30.00	open	•

	<														
	56,442.50	0.0	0.00	4,600.00	3,400.00	11,400.00	25,925.00	2,860.00	3,100.00	14,253.75	14,253.75	-37,603.75	14,253.75		

getAfeTableColumnFunction(targetColumnSelector, functionName)

targetColumnSelector refers to the widget for which the function is to be calculated over all rows.

functionName refers to the function and can be one of the following:

- **Sum**: getAfeTableColumnFunction('.jsID_E_0_3', 'sum')
- **Minimum**: getAfeTableColumnFunction('.jsID_E_0_3', 'min')
- Maximum: getAfeTableColumnFunction('.jsID_E_0_3', 'max')
- Average: getAfeTableColumnFunction('.jsID_E_0_3', 'avg')

14.11.1 Example for sum over one column

For this we need a calculation widget (without content) of type Label with variables for the output. The output value is calculated and entered by the script.

var Write_Sum;

With this we define the JavaScript variable *Write_Sum*

Write_Sum = getAfeTableColumnFunction('.jsID_E_0_3', 'sum');

Herewith we fill the variable *Write_Sum* with the calculation of the sum *getAfeTableColumnFunction('.jsID_E_0_3', 'sum')* over all visible rows of the widget '.*jsID_E_0_3'*.

setAfeWidgetNumValue('.jsID_C_0_0', Write_Sum);

Here we write *setAfeWidgetNumValue('.jsID_C_0_0', Write_Sum);* the calculation stored in the variable *Write_Sum* to the calculation widget '*.jsID_C_0_0*'.

14.12 Use of variables

As already mentioned the use of variables is only possible to a limited extent. If these are to be included in calculations, they must first be output in a widget of the type label with variables and then read from there with the get method.

The JavaScript selector ID of the widget is required.

Widget settir	ngs							
Widget type	Mapping & Other	Features	Visual	Help texts	Data output format			
Label value		<%offset04	ay%>			V		
101 1 445						•		
Hide value of this v	widget if used variable is emp	pty						

OK CANCEL

The variable is output as a label value.

OK CANCEL

Optionally, the widget can also be hidden as 'hidden'.

Example:

setAfeTableWidgetNumValue(this,'.jsID_E_0_7', calcValueNum+
getAfeTableWidgetNumValue(this,'.jsID_E_0_20')

With *setAfe* the value of the JavaScript variable *calcValueNum* is written into the widget '.*jsID_E_0_7*', added with the value of the Apparo variable *<%offsetMay%>*, output in widget '.*jsID_E_0_20*'.

14.13 Using server side variables

SQL variables and script variables can also be recalculated at runtime via Javascript and the result can be reused in the browser.

Example:

var srcElement;

afeReadVariableJs([

```
{name:'variableName', value:'myFeVariable'},
{name:'callbackMethodName', value:'mySecondJsMethod'},
{name:'FE_ID', value: dropdownKey},
{name:'FE_COLOUR', value: dropdownValue} ]);
```

})

```
function myJsMethod(result) {
  setAfeTableWidgetValue(srcElement, '.jsID_E_0_1', 'color code is: '+result[0]);
}
function mySecondJsMethod(result) {
```

```
setAfeTableWidgetValue(srcElement, '.jsID_E_0_1', 'second color code is: '+result[0]);
}
```

If the value of the drop-down widget is changed ('.jsID_E_0_3' or '.jsID_E_0_4'), then the request is sent to the server using the Javascript method **afeReadVariableJs** to resolve the variable **<%myFeVariable%>** and update the text widget '.jsID_E_0_1' according to the result.

The afeReadVariableJs method has these parameters:

- variableName: Name of the variable to be recalculated
- **callbackMethodName**: Name of the Javascript method in the browser that is automatically called after the calculation. This also supplies the calculation result.
- **FE_x**: Parameters are sent to the server as <%FE_x%> variables. This means that the variable must begin with FE_, the rest of the name is freely definable.

In the variable itself, this parameter can then also be used with <%FE_x%>. For example, <%FE PRODUCT ID%>

All parameters must be of type String or Number.

The used script variable:

resultArray;

15 Use of larger JavaScript programmes

With increasing complexity, it is advisable to outsource the JavaScript to an external file.

With the variable:

<%FILE_CONTENT(path+file)%>

you can import the contents of the file again.

Example call of the file myJsFunctions.txt:

<%FILE_CONTENT(D:\My Data\script\myJsFunctions.txt)%>.

The following replaces the variable with the contents of the file:

myAlert(); // <- Example content of the file.</pre>

15.1 Enter key for calling the JavaScript routine

The Enter key is normally used to simulate a click on the OK key. However, if the user is to be able to start the calculations with the enter key, the function "ready" must be extended:

\$(document).ready(function(){

// The business case has been started, the Calc widget is set to 0 setAfeWidgetNumValue('.jsID_C_0_0', 0);

disableFormSubmitOnEnter();
})

With *disableFormSubmitOnEnter();* the enter key is converted and only calls the JavaScript routine.

15.2 Updating the entered numbers to match the existing number format

When entering numbers, e.g. 1000, after clicking the OK button it will be adjusted to the set widget number format, e.g. 1,000.00.

When using the script method, we instead have to call a method to achieve the formatting without having to click the OK button.

Instead of just calling the calculateYearSum function:

\$(document).on('change', '.jsID_E_0_20', function() {
 calculateYearSum(this);
})

We call the method that formats the input values:

```
$(document).on('change', '.jsID_E_0_20', function() {
    setInputWidgetNumFormat(this); // format the numeric and string input values according to the widget
    settings
    calculateYearSum(this);
})
```

15.3 Example of a Table Business Case for planning

In this example, a small planning application is developed.

- 1. The entered annual total is distributed over the annual months, ignoring the previous months (these are "frozen").
- 2. If the user has entered a monthly plan value, the annual total is automatically updated.
- 3. For May, an additional value is automatically added from a hidden "Label with variables" widget.
- 4. The monthly totals for all selected products and the yearly total are automatically calculated.

// calc month sums: calculateColumnSums(); }) }

\$(document).on('focus', '.jsID_E_0_1', function(){

// the user has clicked into the sum widget. Now this function is called automatically.
// This is helpful if you want to make calculations directly after user clicked into a widget

// ... place for activities

})

16 Primary keys & not null columns

Each column (also many columns at the same time) can be used as the primary key.

In this case it is not important how the primary key is defined within the database table. In Apparo Fast Edit you can define a completely different primary key.

Apparo Fast Edit is using the primary key in insert and update case only.

The definition in the database will be not used.

Likewise, only the null/not null-definitions from Apparo Fast Edit will be used. The definition in the database will be not be used.

17 Apparo database repository

All the settings and definitions, beside from the logos and scripts, are stored in the **Apparo database repository**.

For data storage purposes, it is to be recommended that at regular intervals, the repository be saved in the form of a database backup.

The repository is server-independent which means that it can be moved across to another server without changes being necessary (i.e. from the development server to the productive server).

Several Apparo Fast Edit instances can use the same repository at the same time.

An automatic repository-update will ensue with the installation of a new Apparo Fast Edit version. After this, the **older** Apparo Fast Edit versions will be **unable** to **use the same updated repository**.

18 About Apparo

In ,About Apparo' you get in the first line information about the program version and the build.

The next block contains information about the global license key, including the registrar, the expiry date and the maximum number of Business Cases and users.

	About
	Apparo 3.3.0.0 (build: 900-SNAPSHOT)

2 About Apparo	

19 Addendum

19.1 Java class for testing

Examples for a user exit – test if a value of a widget is valid or not:

- TesterPK.java
- TesterNUMBER_VALUE.java

Both are stored in [APPARO HOME]\FastEdit\samples

You need an installed Java 11 JDK because you need javac for compiling.

Java version 11 must be used.

Please open a command shell (cmd/sh) and go into the file directory [APPARO HOME]\FastEdit\samples

Enter now:

javac TestValidator.java TesterPK.java

The result is the file **TesterPK.class** in the same file directory.

Please copy the **TesterPK.class** into the file directory [APPARO HOME]\FastEdit\user_scripts

Now (without restarting Apparo) you can use this file in the Apparo Designer:

Widget settings of database column PLANNING_AMOUNT

Widget type	Mapping & Other	Features	Visual	Help texts	Data output format	
Output type		Number Currency Percentage Date / Time Text Use type of c	putput column		•	
Decimal places	2					
Show separate gr						
How to show nega	with minus si with minus si	ign ign and in red	colour			
Data quality c	heck					
Custom validator	Java 11 class			• 0		
Interval of old valu	ue (%)	ApparoStrin	gValidator			V

19.2 Creating an encrypted password

Passwords in repository and XML files are encrypted using AES256. It is possible to use encrypted pass strings instead of plain passwords

- Within the Apparo Configuration Manager
- In Apparo Designer in database and email connections

Syntax

The file is located in [Apparo-Home]/FastEdit/etc and can be called via script or command line:

CreatePassword.bat/sh PIN PASSWORD

The PIN is always "T9puG" and is used to protect the master password, just like the pin of a credit card.

Output

The standard output is the encrypted password. To use it later, the prefix 'CRYPTED:' must be included.

Example output: "CRYPTED:usUa6Jilr6PGOjta+QFEeCUacDtj,BBDydclflDC73p+e2O+P8Mau"

Use Case

In a company the Designer users must not know the database passwords, therefore the database administrator calls the encryptor with the parameter 'T9puG' and the password 'secret_password123'. The output is like "CRYPTED:xxxxx".

He copies the whole string including the prefix and sends it to the Apparo Designer user who inserts it into the Designer password field (database connection password or eMail account password).

19.3 Database session handling

If a user is starting a Business Case then automatically the Business Case is taking an own database session. A database session is used by one Business Case at the same time only.

If connection pooling is enabled then it is taking the session from the connection pool. If connection pooling is disabled then Apparo Fast Edit is opening a new database session.

Apparo Fast Edit can manage database transactions. This feature is helpful if the user wants to cancel changes and rollback all changes.

If the user is pressing OK, CLOSE or CANCEL button then it has impact to the database transaction too. That means "commit" or "rollback" is used .

If the Business Case is using the "Auto-Commit" feature then after every update/insert/delete command an additional "commit" is used and the transaction is closed automatically.

If the user is closing the Business Case in a correct way (pressing OK or CLOSE button) then the database transaction is closed with a "commit" command too. That means there are no locks because of the usage of this Business Case after the Business Case isclosed by the user.

If the connection pooling is enabled then the database connection will be moved back to the pool. If the connection pooling is disabled then the database connection will be closed.

If the user is closing a Business Case with **just closing the complete window** without pressing OK, CLOSE or CANCEL button then the database session/transaction management is different:

Apparo Fast Edit is testing automatically every minute if a Browser window that is used for running a Business Case isstill open. That means if the user closed the Business Case in a non-official way then the database session is closed **automatically** 5-6 minutes later using rollback.

Calling database procedures and functions:

Using Oracle or IBM DB/2 then it is possible to use the same database transaction like Apparo Fast Edit is using for this Business Case.

If using MS SQL Server then using the same transaction is not possible. Therefore using commit or rollback is not allowed. Solution: Define an own transaction
