

# Apparo Fast Edit

Version 3.3

Data Auditing

... **Data Auditing** is storing automatically additional meta data like user name, current date & time, type of data change, old data value, new data value and so on into a relational database.

## Simple Auditing:

Fast Edit is storing automatically additional

- user name
- date & time
- type of data change (update, insert, delete)

into the target table

## Advanced Auditing:

Fast Edit is storing automatically additional

- user name
- date & time
- type of data change (update, insert, delete)
- **old data value, changed data value**
- the used SQL statement
- Business Case ID
- own expressions

into an **own auditing table**.

This auditing table contains the complete history of all data changes, inserts, deletes and so on (**who has changed what, when and how**)

With Data Auditing every data change can be stored in a relational database:

- **Automatically**
- **Useable by BI system or as input for external systems**
