Data Management

Cost reducing
business process optimizing

![Apparo Group logo]

Business situation

Many business processes are managed by standard software like SAP ERP, Microsoft Dynamics and so on.

For collecting unstructured data companies are typically using a flexible tool like Excel.

Collecting data means:

- data like customer data, controlling data, sales data, time management data, master data, surveys etc.

- analyzing reports and making decisions using Business Intelligence Systems

The business requirements are changing very often.

An ERP system is too inflexible and it is very expensive to enhance it to manage these business requirements.

Excel for collecting data:

Disadvantages:

- Data quality troubles

- Not useable for team work (parallel access?)

- No single source of truth – where is the current Excel sheet?

- No overview

- No defined workflows

Apparo Fast Edit Solution

Business user can define own easy to use data management web applications – no deep IT knowledge necessary

- Excel integration: Importing Data from large Excel sheets, exporting again to Excel with a mouse click

- Ensuring of Data quality

- Ensuring of Data security

- Defining of flexible workflows

Advantage: Process Optimization

- Flexible Workflows definable, departments work together

- Requirements are changing fast - applications are changeable fast too

- Keeping overview about work progress

- The data can be further processed with other software and is not locked in Excel sheets

- Integration into Business Intelligence Systems: Collect decisions and reuse it in other IT systems

Advantage: Cost Reduction

- Less working time necessary to get same results

- Easier usage, less user mistakes

- Integrated into your existing Business Intelligence System: no additional administration costs

- Saving time means getting results faster = better response time
